1. Introduction

1.1 PROJECT DESCRIPTION

Parsons was retained by the Ministry of Transportation Ontario (MTO) to undertake the Planning Phase, Environmental Assessment, and Preliminary Design for the proposed 407 Transitway (407 TWY) from west of Hurontario Street in the City of Brampton, Region of Peel, to east of Highway 400 in the City of Vaughan, Region of York.

The study will follow the Transit Project Assessment Process (TPAP) prescribed in Ontario Regulation 231/08, Transit Projects and Metrolinx Undertakings under the Environmental Assessment Act. This includes submission of the Environmental Project Report (EPR), which summarizes the results of the planning stage. As part of the EPR, a Drainage and Stormwater Management (SWM) study has been prepared to address any potential stormwater runoff impacts resulting from the proposed road improvement plans.

The EPR was submitted on November 2017 and comments from the review agencies were received in February 2018. This report addresses all comments received and is part of the PDR stage of the project.

1.2 PROJECT BACKGROUND

The proposed 407 TWY will be a two-lane, fully grade separated transit facility on an exclusive right-of-way, running along the 407 Corridor. This segment (refer to **Figure 1-1**) of the 407 TWY will be a total distance of approximately 23 km. Seven (7) stations are proposed along the study limits at the following locations: Hurontario Road, Dixie Road, Airport Road, Goreway Road, Highway 50, Highway 27, and Pine Valley Drive. The station layouts will include vehicular and pedestrian access, park and ride and pick-up/drop off (PPUDO) facilities, bus lay bay facilities, on-street integration with local transit, shelters, buildings, and other amenities.

The proposed 407 TWY falls predominately in the jurisdiction of the Toronto and Region Conservation Authority (TRCA), with a small segment extending into the jurisdiction of Credit Valley Conservation (CVC). The segment within TRCA's jurisdiction crosses three (3) watersheds: Etobicoke Creek, Mimico Creek, and Humber River. The short segment within the CVC jurisdiction crosses Fletcher watershed.

1.3 SCOPE OF WORK

The purpose of this study is to analyze and characterize the existing and potential site drainage and SWM facilities associated with the proposed transitway. This study will focus on the development of a drainage and stormwater management plan for the proposed 407 TWY that minimizes impacts on the existing watercourses and drainage patterns. Hydrologic and hydraulic analyses have been undertaken for the proposed water crossings and mitigation measures have been recommended where necessary. There are twenty-four (24) watercourses within the study limits, of which twenty-one

(21) cross the 407 TWY. The remaining watercourses were identified as minor conveyance features with small localized tributary areas that the proposed TWY will not affect because of grade difference.

This study includes the following:

- hydrologic analysis of the proposed 407 TWY to assess any negative impacts on the existing watercourses;
- identification of possible measures to minimize stormwater runoff impacts to fisheries, surface water, groundwater, and wetlands;
- design of SWM facilities for each station site to provide quantity and/or quality control;
- update of existing HEC-RAS models provided by TRCA to establish base models that could be used to assess the impact of the proposed 407 TWY;
- creation of new HEC-RAS models for water crossings that are not included in the TRCA hydraulic models found within the study area;
- hydraulic analysis of proposed 407 TWY structures;
- review and update of existing floodplain mapping within the study area received from TRCA to include the proposed 407 TWY to ensure no increases in water levels are expected beyond the MTO property; and
- creation of new floodplain maps for the creek crossings within the study limits for which existing floodplain maps were unavailable.

This report is intended to illustrate how the drainage system is affected by the proposed 407 TWY and to identify possible mitigation measures required to ensure the stormwater management criteria can be met. In addition, a preliminary hydrologic model has been developed to calculate the storage requirements of stormwater management facilities to ensure Ministry of the Environment and Climate Change (MOECC) and TRCA quality and quantity control criteria are achieved for each watershed.

1.4 OBJECTIVES

The objectives of this study are as follows:

- develop a drainage and stormwater management plan for the proposed 407 TWY that minimizes impact on the existing watercourses and drainage system;
- maintain existing watershed boundaries and drainage patterns;
- manage post-development runoff from road drainage within ROW infrastructure, where feasible;
- improve post-development runoff water quality prior to discharge to the identified site;
- outlet design;
- provide safe drainage conveyance to reduce potential flood risks, and prevent damage to private and public properties;
- undertake a hydrologic and hydraulic analyses of the proposed water crossings; and

- provide mitigation measures where necessary.

2 Hydrologic Analysis

The existing study area, including the existing subwatershed boundaries, water crossings, and the drainage patterns for the 407 TWY corridor are shown in **Figure 1-1**. During the initial phase of the study, field investigations were carried out to inspect the existing structures and surrounding environment within the project limits. The findings of these investigations are shown in **Appendix A.**

2.1 EXISTING CONDITIONS

The existing drainage patterns of the 407 TWY from west of Hurontario St. to east of Highway 400 cross a variety of land use types, ranging from dense commercial/industrial areas to undeveloped open spaces. Overall, drainage is from the north to south. The 407 TWY crosses four (4) major watersheds, three (3) within TRCA jurisdiction, and one (1) within a CVC watershed. The 407 TWY transverses Fletchers Creek (CVC), Etobicoke Creek, Mimico Creek, and Humber River watersheds (TRCA). A small segment of the proposed 407 TWY included in this study falls within Fletchers Creek watershed. This segment ends 55m east of Fletcher's Creek tributary, and thus, is not considered within this study.

As shown in **Figure 1-1,** the Etobicoke Creek watershed is a long and narrow watershed that crosses Caledon, Brampton, Mississauga, and Toronto. The majority of this watershed has been urbanized, however, large sections of the land within the proposed 407 TWY alignment consists of undeveloped, vacant land. Approximately, 1,102.5ha of the Etobicoke Creek watershed is considered as part of the 407 TWY analysis.

For Mimico Creek, approximately 783ha of existing land in the watershed is considered in this study. The 407 TWY drainage areas within this watershed are predominately high density residential, commercial, and agricultural lands. A similar land use composition is found in the Humber River watershed within the proposed 407 TWY corridor. Approximately 786.5ha of the study area lies within the Humber River watershed. The overall catchments within these three watersheds vary in topography with an average slope of 4.2%.

Figures 1-2 through **1-4** show the existing drainage properties of the study area.

2.1.1 Water Crossings

There are twenty-four (24) water crossings within the TRCA-governed watersheds that have been identified within the 407 TWY study limits. Among the 24 watercourses, twenty-one (21) cross the proposed TWY corridor. **Figure A.1** in **Appendix A** shows the location of all existing water crossings. Details of the existing water crossings are summarized in **Table 2-1.**

2.1.2 Site Soil Conditions

Ontario Geological Survey maps were reviewed to determine the soil conditions within the study area, as shown in **Figure A.2** in **Appendix A.** The predominant soil type within the study area is Peel clay; however, there is some variability across watersheds. In Etobicoke, there are sections of Cashel clay and bottom land type soils. The internal drainage in these sections is slow, but contains sufficient fall towards nearby watercourses to allow for adequate external drainage. Typically, these soils can be found within the floodplain. Malton clay, east of Spring Creek, is the soil type that predominately transitions between the Etobicoke and Mimico watersheds. For the most part, the soil conditions in Mimico within the 407 TWY limits are similar to Etobicoke. The Humber River watershed has the greatest variability in soil conditions within the study area limits. While the soil conditions are mostly peel clay, there are instances of sandy loam, including Fox sandy loam east of Emery Creek, Caledon loam along the Mimico border, and Berrien sandy loam near Pine Valley Drive. Clay type soils, including Malton clay, Chinguacousy clay loam, and Jeddo clay can be found along Weston Rd., and just west of Black Creek.

The general topography of the watersheds within the 407 TWY study area is from north to south with an average slope of 4.2%. The smooth, gently sloping nature of the topography creates low internal drainage, thus most sections along the proposed 407 TWY corridor fall into the Hydrologic Soil Group (HSG) C and D classification. These soils groups have the highest runoff potential. There are pockets within the study area that fall into HSG AB, indicating high infiltration capability. Areas such as near Pine Valley Drive and the 407 within the Humber River watershed fall into this category. The soil composition in the watersheds will be confirmed through the geotechnical investigation during the Preliminary Design stage.

2.1.3 Rainfall Data

The 12-hour AES design storm was selected for application in the Etobicoke Creek, Mimico Creek, and 6-hour AES was selected for Humber River watersheds hydrologic and hydraulic modelling. As noted in previous 407 TWY studies, the TRCA requested the AES distribution be applied to the hydrologic modelling of all watersheds. It was selected over both the U.S. Soil Conservation Service (SCS) and Chicago distributions, as it is more suitable for a Southern Ontario study area.

The 4-hour Chicago design storm was selected by MTO for the determination of upstream flows at water crossings where TRCA models were unavailable (refer to **Section 3.1** for details), roadway drainage design, and station stormwater management facility design. This design storm was generated using IDF curves for the year 2092 to account for climate change and the service life of the proposed infrastructure. The rainfall files were developed in Visual OTTHYMO Version 2.4 (VO2) using the latest IDF curves provided by MTO (refer to IDF Curve Look-up, MTO included in **Appendix B**). These IDF curves were generated by interpolating between two existing rain gauges to generate a rain gauge at the midpoint of the 407 TWY located near the interchange between the 407 ETR and Highway 427.

Additionally, design of the storage facilities proposed within this study considered both 4hr Chicago and 12hr AES or 6hr AES(for Humber Watershed) storm events, and a comparison of modelling results is summarized in several tables in the

report. The 12hr AES or 6hr AES remains the design storm as per TRCA's hydrologic modelling of the watershed; the 4hr Chicago is used to comply with the MTO criteria.

2.1.4 Methodology

CVC and TRCA provided watershed maps and hydrologic models for Fletchers Creek, Etobicoke Creek, Mimico Creek, and Humber River for this study. **Figures B.1 to B.4,** included in **Appendix B**, show the watersheds digitized in CAD using original maps from TRCA.

The Etobicoke Creek hydrologic model received from TRCA was developed as part of the Etobicoke Creek Hydrology Update carried out by MMM Group Limited in April 2013. For the existing conditions analysis, each catchment area that transverses the proposed 407 TWY was subdivided to represent areas upstream, downstream, and part of the future 407 TWY right-of-way. The 407 TWY sub-areas were delineated along the extents of the transitway grading to the toe of the embankments or the edge of the retaining walls. The sum of these areas is equal to the total area for each affected catchment area. This process was also applied to the received Humber River and Mimico Creek models. Similarly, these models were recently updated by the TRCA; Humber River in 2015, and Mimico Creek in 2009. **Table B.1** in **Appendix B** show the modification of the TRCA model area parameters for the application of this study.

Figures B.5 and **B.6** in **Appendix B** demonstrate the hydrologic modelling methodology applied for this study. For existing conditions, the input modelling parameters for each 407 TWY sub-area were selected to match the original VO2 input parameters included in the TRCA provided models. **Tables B.2 to B.4** in **Appendix B** show the parameters used in the TRCA model for each watershed. In cases where the larger subwatershed was modelled as a STANDHYD, the same command was used for the analysis of the TWY sub-areas; however, the imperviousness was adjusted to 20%. Similarly, where the larger subwatershed was modelled as a NASHYD/WILLHYD, the same command and input parameters were used to define the 407 TWY sub-area, to be conservative.

For the proposed condition, the input modelling parameters for each 407 TWY sub-area were adjusted to reflect the proposed condition with an impervious level of 90%. **Tables B.2 to B.4** in **Appendix B** show the parameters used in the TRCA model for each watershed, with the exception of the impervious level adjusted to 90%. There were three (3) cases in which the existing condition catchment was modelled as a NASHYD. To reflect the high impervious level, the STANDHYD command was used and the impervious level adjusted to reflect the proposed scenario. These catchments are within the Humber watershed and have the IDs 26.01, 26.09, and 26.02.

2.1.5 Allowable Flow Rates

The land use within the proposed 407 TWY corridor varies from high dense commercial/industrial areas to large swaths of open spaces. Relevant policies from the TRCA generally require any post-development peak flows match to pre-development levels. In the case of Etobicoke, post-development peak flows must be controlled to allowable unit flow rates (TRCA SWM Criteria, 2012).

The TRCA hydrologic (VO2) models were used to determine the peak flow rates based on existing conditions. The calculated peak flow rates for the 407 TWY drainage areas under existing conditions are summarized in **Table 2-2** to **Table 2-5** for the watersheds within this study. As shown in **Figure B.1**, there is only one catchment for Fletchers creek watershed. There was no model provided for Fletcher's Creek. A VO2 model was developed for the 407 TWY area based on available information on the existing site conditions. Detailed hydrological modelling outputs are attached in **Appendix B**.

2. Sub-Areas labelled with green lie in the Sub-Basin 36, and pink areas lie in Sub-basin 46.
3. Sub-Areas labelled with orange are in the basin where quantity controll is not required.

2.2 PROPOSED CONDITIONS

The proposed 407 TWY will cross several catchments within the Fletchers Creek, Etobicoke Creek, Mimico Creek, and Humber River watersheds. The existing drainage patterns will be affected, resulting in a disruption of conveyance of flow due to the proposed roadway. As shown in **Figure B.5**, the larger watersheds areas were further discretized to determine upstream catchment areas, TWY subcatchments, and downstream areas to carry out the analysis of proposed conditions. The following describes the hydrologic analysis completed to determine the impact of the proposed 407 TWY.

Figures 2-1 through **2-3** show the proposed drainage properties of the study area.

2.2.1 Analysis of 407 TWY Sub-Areas

The drainage areas along the proposed 407 TWY were delineated based on the high points and low points along the road profile.

The methodology for determining the outlet controlled rates for the TWY sub-areas (refer to **Figure C.1** in **Appendix C**) was conducted as follows:

- In post-development condition, the assumption was that sub-areas drain from high points to low points. In cases where a sub-area crosses a potential water feature, the strategy was to discharge at such a point. If this was the case, then the area was further subdivided.
- The resulting sub-areas could potentially cross-over two or more larger subwatersheds.
- For sub-areas that drain within the Mimico Creek and Humber River watersheds, the release rates are based on the pre-development peak flow for the 407 TWY sub-area within the larger subwatershed where the discharge point is located.
- For Etobicoke Creek, the release rates are set at each sub-area based on the outlet/low point location using the designated unit rates.

The post-development condition uncontrolled scenario was run to demonstrate the need for stormwater management facilities within the study limits. **Table 2-2-6** to **Table 2-2-9** show the difference in peak flows between the existing and post-development uncontrolled condition. Modelling results indicate that an overall significant increase of approximately 0% to 110% is noted within Fletchers Creek, Mimico Creek and Humber River watersheds. Higher increases up to 180% are noted in Etobicoke watershed due to more stringent criteria for quality control within this watershed (i.e.: unit rates). Modelling results indicate that SWM facilities are required to meet the existing/allowable rates within each subwatershed. Model output files for the uncontrolled scenario for the 407 TWY sub-areas analyzed in V02 are included in **Appendix C**.

2.2.2 Determination of Upstream Flow for Analysis of Water Crossings

There are twenty-one (21) water crossings that will be directly affected by the proposed 407 TWY. TRCA provided the hydraulic model for ten (10) water crossings: E5, E7, E8, M4, M7, M8, H1, H5, H6, and H7. No further hydrologic modelling was completed for these crossing. For the remaining water courses, a hydrologic analysis of the drainage areas upstream of the proposed 407 TWY was undertaken. Drainage area maps were delineated for the eleven (11) water crossings and are included in **Appendix D**.

The original model parameters from TRCA were maintained in the hydrologic analysis, and areas were adjusted to reflect the drainage boundary at the upstream side of the proposed 407 TWY. The Chicago 4-hr distribution using MTO's IDF curves was used in this analysis and peak flows for all upstream areas are summarized in **Tables 2-10 – 2-12**. These flows were further used in the HEC-RAS analysis of the proposed structures (refer to **Section 3**). VO2 modelling output files are included in **Appendix D**.

** Hydraulic model for water crossing provided by TRCA and includes additional upstream areas not found in this study. The Hydraulic models use TRCA flows, not the ones shown in this table

3 Hydraulic Analysis

The proposed 407 TWY contains twenty-four (24) watercourses within the study limits, of which twenty-one (21) cross the 407 TWY corridor. The remaining watercourses were identified as minor conveyance features with small localized tributary areas that the proposed TWY will not affect because of grade differences. **Table 2-1** (in **Section 2**) provides details of all crossings within the study limits and summarizes information reviewed from a variety of sources such as hydrologic modelling documentation, watershed studies, available approved hydraulic models, and floodplain maps received from CVC and TRCA. In addition, **Table 2-1** identifies each potential water crossing along the proposed 407 TWY. A HEC-RAS modelling analysis was undertaken to design new structures at each water crossing location to evaluate and identify any effects due to the 407 TWY construction.

3.1 METHODOLOGY

TRCA regularly generates, maintains, and updates HEC-RAS models and floodplain maps for a majority of the creeks within its jurisdiction. Parsons received several HEC-RAS models from TRCA for the watercourses within the 407 TWY study area. Each model was reviewed carefully and the approximate location of watercourses within the 407 TWY were identified. For crossings in which a TRCA model was received, the cross sections located within the 407 TWY corridor were updated based on the recent survey completed by J.D. Barnes. For water crossings without any available HEC-RAS model, a new geo-referenced model was created. During the modelling process, it was noted that all TRCA HEC-RAS models have been set up on the UTM coordinate system while all surveyed data and AutoCAD files were based in the MTM coordinate system. Transferring the MTM-based AutoCAD files to an UTM coordinate system is a labour-intensive process. It was decided that all TRCA files were to remain in the UTM coordinate system for the update of the models; and for all new HEC-RAS models, the MTM coordinate system was assigned. **Figure A.1** in **Appendix A** shows the location of each crossing within the study limits, and indicates the availability of TRCA HEC-RAS models.

The approach for the update and development of the new HEC-Ras model commenced with the creation of a digital surface from the survey data using AutoCAD Civil 3D. Once the surface was established, cross sections were generated within the 407 TWY corridor upstream and downstream of existing and proposed structures at 50 m intervals. For creeks with an available HEC-RAS model, only the sections within the corridor were updated, and flow data was left unchanged as these models contained extensive flow information from upstream drainage areas. For other creeks without an existing TRCA model, cross sections were exported to HEC-RAS model to create a georeferenced geometry file, and flows input based on the upstream flows shown in **Table 2-10** to **Table 2-12**. Flow rates were calculated upstream of 407 TWY based on the watershed areas discharging to a specific watercourse. For the details of the flow rate calculations, refer to **Section 2.2.2**.

Two scenarios were considered to understand the influence of the proposed 407 TWY on the existing water crossings. The Existing Condition scenario included only the hydraulic structures presently at the 407 ETR, as well as any local structures immediately upstream or downstream that could have a potential impact. The Proposed Condition analysis included the proposed 407 TWY structure. **Table 3-2** provides a summary of the existing and proposed structures.

3.2 HYDRAULIC DESIGN CRITERIA

The following standards from MTO Highway Drainage Design Standards (Jan 2008) were used:

Table 3-1: Summary of Hydraulic Design Criteria

WC-1: Design Flows (Bridges and Culverts)

Functional Road Classification	*Return Period of Design Flows (Years)*		*Check Flow for Scour*
	Total Span less than or equal to 6.0 m	*Total Span greater than 6.0 m*	
Freeways, Urban Arterial	50	100	130% of 100 Year

WC-2: Freeboard and Clearance at Bridge Crossings

- The minimum freeboard is measured vertically from the High-Water Level for the Design Flow (50-yr/100-yr WL) to the edge of the travelled lane, the freeboard at bridge crossings shall be greater than or equal to 1m for freeways
- The clearance is measured vertically from the High-Water Level of the Design Flow to the lowest point on the soffit; the clearance for freeways shall be greater than or equal to 1m.
- The WL generated by the Check Flow shall not exceed the elevation of the edge of the travelled lane.

WC-7: Culverts Crossings on a Watercourse

- Freeboard for the design flow should be at least one (1) m. Minimum freeboard is measured vertically from the high-water level for the design flow to the edge of the travelled lane
- Clearance for open footing culverts should be 0.3m clearance is measured vertically from the high-water level for the design flow to the straight soffit.

WC-8: Minimum Culvert Size

- 800mm minimum diameter for circular culverts
- 900mm minimum rise for box culverts

3.3 HYDRAULIC ANALYSIS

Table 3-2 summarizes the hydraulic analysis of all water crossings and their respective structures. **Tables 3-3** through **3-5** identify water crossings and compares the water levels for the 50-year, 100-year, and regional storm events immediately upstream of the proposed TWY crossings.

(*) Based on background data review (to be confirmed during detailed design)
(**) in these cases the vertical alignment of the corridor slopes to the underground and measures are needed to avoid water entering the underground portion of the corridor
(***) Controlled flow results from SWM Pond Upstream - Refer to report

Notes:
Culverts/bridges with a total span less than or equal to 6.0m are designed for 50yr storm (MTO Standard WC-1)
Culverts/bridges with a total span greater than 6.0 are design for the 100 yr storm (MTO Standard WC-1)
Freeboard calculated as the difference between the WL generated by the design flow and the EOTR
Clearance calculated as the difference between the lowest point on the soffit and the design flow
Check flow criteria was assessed for crossing included in the HEC-RAS ROUGE model (HEC.prj) created by Parsons
Check flow criteria for TRCA models assessed in the report
[1] Flood Depth at culverts is calculated as follows:

3.3.1 Etobicoke Creek Watershed

Seven (7) tributaries cross the 407 TWY within the Etobicoke Creek watershed. These water crossings have been named as E1 to E8. Although E2 does not traverse the 407 TWY, it has a confluence point with E3 south of 407 TWY; therefore a single HEC-RAS model was created for E2 and E3. A new HEC-RAS model was created For E1 and E4, and existing TRCA HEC-RAS models were obtained for E5, E6, E7 and E8. **Table 3-6** describes the changes made to the HEC-RAS models for this study.

Appendix D includes figures that show the delineation of the upstream catchment areas of the proposed 407 TWY structures and **Appendix E** includes the floodplain maps that show the location of all HEC-RAS cross-sections used in the HEC-RAS model as well as the delineation of the existing and proposed Regulatory floodline, which is the Regional event for this project.

For the watercourse (tributary area: 3.77 hectares) between Kennedy and 410 that was not defined in the drainage data map, a pipe culvert with 900mm diameter is sufficient for conveyance after going through the preliminary hydraulic analysis. In the detailed design stage, further investigation and analysis should be undertaken to consider any changes related to HuLRT Maintenance and Storage Facility (MSF) south of 407 ETR. Modelling Results can be found in **Appendix D.**

Table 3-6: HEC-RAS Model Considerations for Etobicoke Creek Water Crossings

Water Crossing ID	HEC-RAS Model	Coordinate System	Modifications to HEC-RAS Model
E1	NEW MODEL	MTM	-
E2-E3	NEW MODEL	MTM	-
E4	NEW MODEL	MTM	-
E6	TRCA MODEL	UTM	Sections updated within the TWY corridor except those upstream and downstream of Dixie Road. Model runs via HEC-RAS 4.01 version. Highway 407 culvert size revised in TRCA HEC-RAS model according to as-built drawing.
E5-E7-E8	TRCA MODEL	UTM	The model runs with HEC-RAS 4.1 version. To include E8 in TRCA model, a portion of the creek was extended northward. The tributary including E7 was shifted to its correct location. For E5, the model had a geo-reference issue. TRCA and Parsons cross sections were compared in an Excel file and sections within the TWY corridor were updated.

Water crossing E1 is one of the western tributaries of Etobicoke Creek, located between Hurontario Street and Kennedy Road within the 407 TWY study limits. The tributary flows north to south, traversing Highway 407 through a 3.5m x 2.5m box culvert. A structure of the same size was considered for the E1 water crossing. **Figure D.1** in **Appendix D** shows the location of the creek. As there was no TRCA HEC-RAS model available for this crossing, a new model was created. **Table D.1** in **Appendix D** presents the results of modelling.

The HEC-RAS modelling results show that minimal increases in water levels occur upstream of the 407 ETR, however, no impacts exist downstream of the proposed 407 TWY. **Figure E1** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline.

Water crossing E3 is located east of Kennedy Road within the 407 TWY corridor. This tributary flows north to south, crossing the Highway 407 through a 3m x 2.2 m box culvert. A structure of equivalent size was considered for the E3 water crossing. **Figure D.4** in **Appendix D** shows the location of the creek. There was no TRCA HEC-RAS model available for this crossing therefore a new model was created. **Table D.3** in **Appendix D** presents the results of modelling.

The modelling results show that the water level increased between two structures upstream of TWY. The increase is within the TWY ROW limit, and there is no negative impact to the upstream of Highway 407 or downstream of TWY; therefore, the

modelling results are acceptable. **Figure E2** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline.

Water crossing E4 is one of the western tributaries of Etobicoke Creek and is located west of Highway 410 within the 407 TWY corridor. The tributary flows north to south, crossing Highway 407 through a 1.0 m dia. pipe culvert. A structure of the same size was considered for the E4 water crossing. **Figure D.4** in **Appendix D** shows the location of the creek. There was no TRCA HEC-RAS model available for this crossing therefore a new model was created. **Table D.4** in **Appendix D** presents the results of modelling.

The modelling results show that the water level increased between two structures, on the section right upstream of the 407 TWY only; however, the increase is within the TWY ROW limit. There is no negative impact to the upstream condition of Highway 407 and downstream of the 407 TWY. **Figure E2** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline.

Water crossing E5 is located between Highway 410 and Tomken Road within the 407 TWY corridor, flowing north to south, crossing highway 407 through a bridge structure. Proposed 407 TWY bridge has a span of 160m. **Figure D.11** in **Appendix D** shows the location of the creek. The TRCA HEC-RAS model was available for this crossing. Cross sections located within the TWY corridor were updated to reflect the new survey information. **Table D.5** in **Appendix D** presents the results of modelling.

The modelling results show that the water level slightly increased between the two structures, upstream of the proposed 407 TWY within the TWY ROW limit. As there is no negative impact to the upstream condition of Highway 407 and downstream of the 407 TWY beyond the ROW limit, therefore the modelling results are considered acceptable. **Figure E3** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline.

Water crossing E6 is one of the tributaries of Etobicoke Creek, located between Highway 410 and Dixie Road within 407 TWY corridor. It flows north to south, crossing Highway 407 through a 5.5x2.8 m twin box culvert and Dixie Road through an arch culvert. Proposed 407 TWY bridge has a span of 100m. **Figure D.11** in **Appendix D** shows the location of the creek. There is a TRCA HEC-RAS model available for this crossing. Sections located within the TWY corridor were updated to reflect the new survey information. **Table D.6** in **Appendix D** presents the results of modelling.

The modelling results show a slight increase in water levels associated with the smaller storm events, up to 10-yr in the section of the creek located between 407 TWY and Dixie Rd. There is no negative impact to the downstream of Dixie Station. **Figure E4** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline.

Water crossing E7 is one of the main tributaries of Etobicoke Creek. It is located east of Dixie Road within the 407 TWY corridor, flowing north to south. It crosses Highway 407 through a 4.62x2.80 m twin box culvert. A structure of equivalent size was considered for the E7 water crossing. **Figure D.11** in **Appendix D** shows the location of the creek. A TRCA HEC-RAS model available for this creek, however the model extended up to the junction of E7 and E8, downstream of 407 ETR. The model was extended by Parsons to include E7 and E8 reaches/crossings. Sections located within the TWY corridor were updated to reflect the new survey information. **Table D.7** in **Appendix D** presents the results of the modelling.

The modelling show that the water level increased slightly between the two structures; however, the water level changes are within the ROW limit. There is no negative impact upstream of Highway 407 or downstream of the 407 TWY. **Figure E5** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline.

Water crossing E8 is a main tributary of Etobicoke Creek. It is located west of Bramalea Road within the 407 TWY corridor. It flows from north to south, crossing Highway 407 through a bridge structure. Proposed 407 TWY bridge has a span of 120m. **Figure D.11** in **Appendix D** shows the location of the creek. There was a TRCA HEC-RAS model available for this crossing. Sections located within the 407 TWY corridor were updated to reflect the new survey information. **Table D.8** in **Appendix D** presents the results of the modelling.

As shown in the modelling results, the water level increased slightly between two structures, but this increase is limited within the ROW. Thus, there is no negative impact upstream of the Highway 407 and downstream of the 407 TWY. **Figure E6** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline.

3.3.2 Mimico Creek Watershed

The Mimico Creek watershed extends approximately from Bramalea Road to Goreway Drive. There are eight (8) locations in which the creek's tributaries traverse the proposed 407 TWY. The crossings have been named, west to east, as M1 to M8. For crossings M1, M2, M3, M5, and M6, new HEC-RAS models were created. Crossings M4, M7, and M8 were identified in the HEC-RAS models obtained from TRCA. **Table 3-7** describes the modifications that have been made to the obtained TRCA models.

Table 3-7: HEC-RAS Model Considerations for Mimico Creek Water Crossings

WATER CROSSING NO.	HEC-RAS MODEL	COORDINATE SYSTEM	MODIFICATIONS TO HEC-RAS MODEL
M1-M2	NEW MODEL	MTM	
M3	NEW MODEL	MTM	
M5-M6	NEW MODEL	MTM	
M4-M7-M8	TRCA MODEL	UTM	Model based on HEC-RAS 4.01 version. Cross sections located within the 407 TWY corridor were updated.

Water crossings M1 and M2 are located east of Bramalea Road and have a confluence point south of future 407 TWY. They flow from north to south, crossing Highway 407 through a 7.2m x 2.7m box culvert and a 1.2 m dia. pipe, respectively.

The proposed 407 TWY structure for M1 is 7.2 x 2.7m, whereas the proposed structure for M2 is a box culvert of 2.5x1.5 to ensure no negative impacts upstream or downstream of the proposed TWY.

Figure D.18 in **Appendix D** shows the location of these crossings. There was no TRCA HEC-RAS model available for these crossings and a new model was created. **Table D.9** and **Table D.10** in **Appendix D** present the results of modelling.

The modelling results for M1 show that the water level decreased slightly between the two structures. There is no negative impact to the upstream condition of Highway 407, or downstream of the 407 TWY. **Figure E7** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline.

The modelling results for M2 show that the water levels slightly increased between the two structures, but are contained within the ROW. There is no negative impact to the upstream condition of Highway 407 or downstream of the 407 TWY. **Figure E8** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline.

Water crossing M3 is located west of Tomken Road within the 407 TWY corridor. This tributary flows north to south, crossing Highway 407 through a 4.7m x 2.55m box culvert. An equivalent-sized structure was considered for the M3 water crossing. **Figure D.18** in **Appendix D** shows the location of the creek. As there was no TRCA HEC-RAS model available for this crossing, a new model was created. **Table D.11** in **Appendix D** presents the results of the modelling.

The modelling results show that the water level increased between two structures and upstream of Highway 407; however, the water level changes are within the ROW limit. There is no negative impact upstream of Highway 407, or downstream of TWY. **Figure E9** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline.

Water crossing M4, located between Tomken Road and Airport Road within the 407 TWY corridor, is a major tributary of Mimico creek. This tributary flows from north to south, crossing Highway 407 through a 4m x 3.0m twin box culvert. A structure of the same size was considered for M4 water crossing at the 407 TWY. **Figure D.18** in **Appendix D** shows the location of the creek. A TRCA HEC-RAS model was available for this crossing, therefore the sections within the 407 TWY corridor were updated to reflect the latest survey information. **Table D.12** in **Appendix D** presents the results of modelling.

The modelling results show increases in water levels between Highway 407 and 407 TWY, however they are contained within the two highways. Upstream of the existing 407 ETR there is a slight increase in the Regional event between Highway 407 and Steels Ave. due to the proximity of the two structures. There is no negative impact downstream of 407 TWY. **Figure E10** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline.

Water crossings M5 and M6 are major tributaries within the Mimico Creek Watershed. These crossings are located between Tomken Road and Airport Road within the 407 TWY corridor. The tributaries flow from north to south, with a confluence point south of the 407 TWY. Water crossings M5 and M6 transverse Highway 407 through a 4.5m x 3.5m and 6.3m x 1.5m box culverts, respectively. The proposed 407 TWY structures are 6m x 2m for M5 and 6.3m x 1.5m for M6.

Figure D.27 in **Appendix D** shows the locations of the creeks. There was no TRCA HEC-RAS model available for these crossings therefore a new HEC-RAS model was created for M5 and M6. **Table D.13** and **Table D.14** in **Appendix D** present the modelling the results.

The modelling results for M5 show slight increases in water levels between Highway 407 and proposed 407 TWY, however, water levels are contained within the ROW. There is no negative impact on the upstream condition of Highway 407 or downstream of the 407 TWY.

The modelling results for M6 show that there is no negative impact upstream of Highway 407 or downstream of 407 TWY. **Figure E11** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline for both crossings.

Water crossing M7 is located east of the Canadian National Rail (CNR) crossing, conveying flows from north to south. M7 has a confluence point with M5 and M6 south of 407 TWY (refer to **Figure D.27** in **Appendix D**). This tributary traverses Highway 407 via a bridge structure of approximately 35m. In the proposed condition analysis, the structure proposed for the M7 crossing of 407 TWY is a bridge with a span of 60m. The existing TRCA HEC-RAS model was updated to reflect survey information, however the model will need further refinements during detailed design; it was observed that structures downstream of the proposed TWY are considerably reduced in size and some of them (culvert on Steels Ave. – 9.1m x 3.1m and culvert on Goreway Ave, 4.9 x 1.72m.) are modelled with no slope. Modelling results indicate that the 60m bridge proposed on 407 TWY does not meet the MTO standards for clearance to the soffit of the bridge, however this structure provides the largest opening compared to all existing structures for this creek in the vicinity of the proposed TWY. A berm at approximately 174m top elevation is proposed to be constructed between the existing Highway 407 and the proposed TWY to ensure the spread of Regional water level is contained in the vicinity of the M7 structure and it will not create a negative impact on the Goreway Sttaion. **Table D.15** in **Appendix D** presents the results of the modelling.

The modelling results indicate that there are no increases in water levels upstream of downstream of he proposed structure. **Figure E12** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline for this crossings.

Water crossing M8 is located west of Gorewood Drive, flowing north to south. It crosses Highway 407 through a 6.0m x 2.0 m box culvert. A structure of the same size was considered for M8 water crossing. **Figure D.33** in **Appendix D** shows the location of the creek. The available TRCA HEC-RAS model was updated to reflect survey information. **Table D.16** in **Appendix D** presents the results of modelling.

The modelling results show that there is no negative impact upstream of Highway 407 or downstream of 407 TWY. **Figure E13** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline for this crossing.

3.3.3 Humber River Watershed

There are six (6) locations at which tributaries cross the proposed 407 TWY within the Humber River watershed. The crossings are identified from west to east, as H1 to H8. It should be noted that H3 and H4 will not cross the 407 TWY, as they are located south of the alignment. **Table 3-8** shows the modifications applied to the TRCA models.

Table 3-8: HEC-RAS Model Considerations for Humber River Water Crossings

WATER CROSSING NO.	HEC-RAS MODEL	COORDINATE SYSTEM	MODIFICATIONS TO HEC-RAS MODEL
H1	TRCA MODEL	UTM	H1 located on at Reach 4- West branch, Trib H3. TRCA file did not include Highway 407 bridge piers; therefore, bridge piers were included in the model update
H2	NEW MODEL	MTM	
H5	NEW MODEL	MTM	H5 and H6 were located in TRCA model but the configuration of the confluence point of H5 and H6 was not correct. Separate models were created for these crossings and TRCA model flows were utilized to perform the modelling.
H6	NEW MODEL	MTM	
H7	TRCA MODEL	UTM	H7 is located in Main Humber
H8	NEW MODEL	MTM	No Highway 407 structure was included in the model because the creek starts just downstream of the 407

Water crossing H1 is a major tributary within the Humber River watershed. It is located between Gorewood Drive and Highway 50 and conveys flows from north to south. The tributary crosses Highway 407 through a bridge structure of approximately 140m. A structure of equivalent size (120m span bridge) was considered for the H1 water crossing. **Figure D.36** in **Appendix D** shows the location of the creek. A TRCA HEC-RAS model was available for this crossing, and the sections within the 407 TWY corridor were updated to reflect the survey information. **Table D.17** in **Appendix D** presents the results of modelling.

The modelling results show that there is no negative impact upstream of Highway 407 or downstream of the 407 TWY. **Figure E14** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline for this crossing.

Water crossing H2 is located on Albion Creek between Highway 427 and Highway 27, transversing Highway 407 through a long box culvert. A structure of the same dimensions as the Highway 407 culvert was considered for the H2 water crossing. **Figure D.36** in **Appendix D** shows the location of the creek. There was no TRCA HEC-RAS model available for this crossing, therefore a new model was created for the proposed condition. The existing conditions were not modeled due to the ongoing realignment of Albion Creek as part of 407 ETR Patrol Yard Expansion project on an adjacent property (see **Figure**

D.39 in Appendix D). Once construction has finished on these adjacent lands, an investigation may take place to gather the necessary information to provide a valid comparison between existing and proposed conditions. The enclosure of the creek through Hwy 27 station was discarded in response to TRCA's comments. An open channel has been designed to convey flows across the proposed TWY and parking lot, towards Steels Ave. No road overtopping is expected and although the Regional water levels exceed the channel storage capacity just upstream of the proposed TWY they are fully contained within the channel that is proposed to run through the parking lot.

The HEC-RAS modelling results indicate that the water levels pose no negative impact upstream of Highway 407 or downstream of the transitway. In addition, modelling results show that water levels would not flood the 407 ETR off-ramp. Table D18 summarizes the proposed water levels at all cross sections analyzed. Figure E15 in Appendix E shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline for this crossing. The two proposed ponds for the Hwy 27 station are located outside the Regional water levels.

Water crossings H5 and H6 are located east of Martin Grove Road, with a confluence located south of the 407 TWY. H5 and H6 traverse Highway 407 through a pipe and a bridge structure respectively. Similar structures were considered at the H5 and H6 water crossing locations. There was a TRCA HEC-RAS model available, however, it was determined after review of the file that the confluence point of H5 and H6 did not represent the existing configuration accurately. A detailed field investigation was completed in early September 2017. Results of the site visit are shown in Appendix A. A large channel was found north of Highway 407. In conveys flows from west to east and converges upstream of the watercourse leading to H6. The inlet of H5 was found along this large channel but is the remnant of the historic water course. Most flows presently bypass this connection and are conveyed downstream through the channel with the crossing noted as H6. The H5 water crossing was modelled using HY-8, which used headwater levels generated from the TRCA model as inputs.

Table. D.19 in Appendix D presents the results of modelling for water crossing H6. The modelling results show that there is no negative impact on the upstream condition of Highway 407 or downstream of the 407 TWY.

Water crossing H7 is located west of Islington Avenue, carrying flow from north to south across Highway 407 through a bridge structure. Since the same flow will pass through the structure at the 407 TWY, a structure of similar size was considered for the H7 water crossing. There was a TRCA HEC-RAS model available for this crossing; the sections within the 407 TWY limit were updated to reflect the survey information. Table D.20 in Appendix D presents the results of the modelling.

The modelling results show that there are minimal increases in water levels upstream of Highway 407 however no increases are expected downstream of 407 TWY. Figure E18 in Appendix E shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline for this crossing.

Water crossing H8 is located east of Pine Valley Drive, conveying flows from north to south. Highway 407 drainage contributes to watercourse headwaters, and similar to the H5 crossing, there is a 1m-diameter pipe under the 407 Highway at this location. It appears that only the highway drainage is conveyed downstream via the 1m dia. pipe. Figure D.50 in Appendix D shows the location of the creek. There was no TRCA HEC-RAS model available for this crossing; therefore, a new HEC-RAS model was created.

Review of the topography indicated an upstream drainage area of 279ha. The initial assessment concluded that a 1m-diameter pipe would not be appropriate for a drainage area of this magnitude. To confirm the drainage area, a field investigation was completed in early September 2017. The results of the field visit are summarized in **Appendix A**. Visual inspection indicated a drainage divide between Highway 407 and the subdivision north of the highway. Dry ponds exist on both the northwest and southwest side of the highway ramps; however, the outlets for the 407 highway ponds could not be confirmed. It is suspected that the subdivision drains to the Aviva Park Pond, City of Vaughan Pond #80, where runoff is treated and discharged to the watercourse leading to H8. These details will be investigated further at the Preliminary Design stage. Quantification and modelling of the Aviva Park Pond and other existing SWM controls in the area could reduce the amount of flow leading to H8; however, the worst-case scenario was considered for this report, which assumes runoff from all 350ha flow to water crossing H8.

A bridge spanning 45m was proposed for this crossing. Dredging was proposed at this location to convey large flows, as the transitway alignment at this crossing is near the existing grade. The channel would need to be lowered by approximately 3m to meet freeboard requirements; further dredging would be required to meet clearance requirements. The feasibility of dredging in this area will be analyzed during detailed design stage. The 407 TWY profile has been raised providing the highest elevation possible at this location, considering the transmission cables. The revised profile clears the 100-yr water levels.

The modelling results indicate that the water level has increased between two structures only within the TWY ROW limit, and causes no negative impact to the upstream of Highway 407. **Figure E19** in **Appendix E** shows the HEC-RAS cross sections used in the hydraulic model and the delineation of the regulatory floodline for this crossing.

4 Stormwater Management

4.1 STORMWATER MANAGEMENT CRITERIA

Through consultation with the Ministry of Transportation (MTO) Drainage, TRCA, and CVC, the following stormwater management criteria will apply to the 407 TWY and stations.

Table 4-1: Stormwater Management Criteria

Quantity Control	• CVC – Fletchers Creek Watershed: Post to Pre-control of peak flows to the appropriate watershed. • TRCA – o Mimico Creek Watershed: Control post-development peak flows to pre-development levels for all storms up to and including the 100-year storm (Mimico Hydrology Update, Marshall Macklin Monaghan, 2009) o Etobicoke Creek Watershed: Unit flow rates have been established and should be used for all sites that require control (TRCA Stormwater Management Criteria, V 1.0, Aug 2012) o Humber River Watershed: Control post-development peak flows to pre-development levels for all storms up to and including the 100-year storm (i.e., 2, 5, 10, 25, 50, and 100 year storms) except for the main branches of the Lower, Main, East, Upper and West. Unit flow relationships have been established and should be used for all other sites located in the Humber River Watershed not discharging to the main channels listed above. (Humber River Watershed Hydrology Update, Aquafor Beech Ltd., Nov. 2002)
Quality Control	Enhanced protection (Level-1) criteria to determine the minimum permanent pool size for wet pond facilities Table 3.2 of the Stormwater Management Planning and Design Manual (MOECC, 2003) Where applicable, water quality controls should be further informed by goals and objectives arising out of applicable subwatershed studies and source water protection plans. [CVC SWM criteria, 2012)
Erosion Control	At minimum, 5 mm retention for each station area, as per TRCA SWM Criteria (2012) CVC – - At minimum detail 5 mm on site where conditions do not warrant a detailed analysis - For sites with SWM ponds, 25mm – 48hr detention may be required, depending on the results of the erosion assessment.
Thermal Considerations	3m permanent pool depth and others (e.g.: cooling trenches) (Guidance for Development Activities in Redside Dace Protected Habitat, MNRF V 1.1 (2014) To minimize thermal impacts, preventative measures (i.e. LID practices) and mitigation measures should be applied) (CVC, 2012)
Water Balance	For low volume groundwater recharge areas (LGRA), site specific water balance analyses are typically not required, and best efforts to maintain recharge are expected. For natural features (woodlands, wetlands, watercourses) maintain hydrologic regimes and hydroperiods.

	Planning and design of infiltration facilities must consider soil conditions, depth of water table, and the presence of vulnerable areas such as Wellhead Protection Areas (WHPA's). Infiltration of untreated stromwater from some sources (e.g, industrial facilities, roads, parking lots) to the groudwater may be prohibited. Consultation with TRCA is required to establish water balance methodologies and criteria, particularly for sensitive ecological features where baseline monitoring is necessary to establish appropriate criteria.

4.2 PROPOSED STORMWATER MANAGEMENT STRATEGY

The stormwater management strategy proposed for the 407 TWY corridor is to implement enhanced swales. The strategy is proposed in previous 407 TWY studies, and is an accepted mitigation solution as wet ponds are not feasible due to associated drainage areas being less than the 5.0ha requirement. The proposed strategy is shown in **Figure C.1** and **C.2** in **Appendix C**.

4.2.1 407 Transitway Corridor

A hydrologic analysis was undertaken for the project to quantify the amount of storage required to achieve the allowable discharges within each subwatershed. This section discusses the post-development condition controlled scenario undertaken for the 407 TWY sub-areas. In addition, five stations are proposed along the study limits and their stormwater management strategy is presented in **Section 4.2.1.4** of this report.

The 407 TWY sub-areas delineated along the proposed 407 TWY alignment are shown in **Figures C.1 in Appendix C**. The drainage area at each 407 TWY outlet is less than 5 ha, therefore wet ponds are not feasible to be constructed to provide quality and quantity control for the paved area of the running way. A treatment train approach is implemented consisting of grassed embankments to promote sheet flow, grassed swales on both sides of the 407 TWY and enhanced grassed swales/dry ponds located before each outlet from the 407 TWY. The drainage strategy of the 407 TWY sub-areas within each subwatershed including details related to discharge points of each swale as well as quantity control criteria are presented in **Table C.1 in Appendix C.**

4.2.1.1 PROPOSED ENHANCED SWALE DESIGN

Grassed swales are proposed along the entire length of the 407 TWY. Since the swales will follow the slope of the road, which in some instances is steep, segments of enhanced swales are proposed before any stormwater discharge to a watercourse or any other type of outlet. The enhanced swales would cover approximately 50 m length and are designed to have a trapezoidal cross-section, flat bottom (4 m wide), 2:1 side slopes and a depth of 1.5 m. A longitudinal slope of maximum 0.2% is proposed for all swales to provide settlement of sediment and to reduce flow velocities from upstream segment. To increase the time of flow in the swales and to promote infiltration at the same time, two cells are proposed with a 0.5 m layer of clear stone covered by 0.3 m of topsoil below the invert of the swale. The enhanced swales were designed in a form of dry ponds with a formal outlet control structure to provide quality and quantity control for 407 TWY sub-areas. The outlet is comprised of a 100-mm perforated pipe proposed to be installed at the bottom of each swale that is further connected to a hickenbottom structure equipped with a 75-mm orifice plate. Some enhanced swales applied along the 407 TWY only have 75-mm orifice for the outlet structure, but for some others, a length of 0.15m Weir with different hydraulic heads (0.5m, 0.4m and 0.2m) is also included in the outlet. Details of outlet type selected for swales in different 407 TWY sub-areas are showed in the notes of **Table 4-2 to Table 4-5.**

Swale details are shown in **Figure C.2** in **Appendix C.**

The maximum volume that can be stored in an enhanced swale is calculated to be 525 m^3. The controlled discharge rate from the swale was calculated to be 0.015 m^3/s using the orifice equation (75 mm diameter), 0.112 m^3/s is calculated using orifice and weir with 0.5 m hydraulic head, 0.084 m^3/s is calculated using orifice and weir with 0.4 m hydraulic head, 0.039 m^3/s is calculated using orifice and weir with 0.2 m hydraulic head, – refer to **Table C.1** to **C.4** in **Appendix C**.

For modelling purposes, it is considered that the swale volume used is maximized, and the maximum discharge would be used. This approach is conservative since we are using the minimum allowable orifice and providing more storage than required.

4.2.1.2 QUANTITY CONTROL

Table C.5 in **Appendix C** shows the storage requirements for each proposed swale. **Figures 2-1** through **2-3** show the locations of all swales identified along the 407 TWY. Where volume requirements exceed the maximum available for a single swale unit (i.e. 525 m^3), additional swales are proposed to provide the required volume.

Based on the quantity control requirements summarized in **Table C.5**, hydrologic modelling was conducted to demonstrate the performance of mitigation measures.

Table 4-2 to **Table 4-4** show the results of the hydrologic analysis for all conditions analyzed. The results indicate that no increases are expected within the entire watersheds.

4.2.1.3 QUALITY CONTROL

To support our use of enhanced swales and to prove the efficiency of the enhanced swales for 407 TWY sub-areas, Parsons undertook a literature review (see reference materials 1 to 4 at the end of this Report). The removal efficiency of grassed swales is noted in several reference materials. As noted in Reference 9 (“Highway Runoff Water Quality Literature Review, MAT-92-13, MTO Research and Development Branch, April 1992”) and Reference 10 (“Performance Assessment of a Swale and Perforated Pipe Stormwater Infiltration System”), the enhanced grassed swales can achieve between 76% and 90% reduction in total suspended solids generated by highway runoff.

Oil grit-separators (OGS) are well known for their application in urban areas where there is limited space for stormwater management facilities. They are most likely to be used in defined impervious areas where the storm runoff is concentrated and collected in a piped system. In addition, the units provide only 50% TSS removal as indicated by the New Jersey Department of Environmental Protection.

Due to the reasons listed above, Parsons recommends the use of treatment train approach consisting of grassed embankments, grassed swales and enhanced grassed swales to provide quality and quantity control of 407 TWY sub-areas.

Table 4-2:Modelling Results - Proposed Condition with SWM Peak Flows (m³/s) - 407 TWY Sub-Areas (Fletchers Creek & Etobicoke Creek Watersheds - 12hr AES)

Note:
1. Qp-ex is the allowable flow.
2. ES-1, ES-2, ES-4 are individual enhanced swales which have 75mm orifice only.
3. ES-8 are individual enhanced swales which have 75mm orifice and weir with 0.5m hydraulic head.
3. ES-5 is one enhanced swale which has 75mm orifice and weir with 0.5m hydraulic head.
4. ES-3 includes two individual enhanced swales which have 75mm orifice and weir with 0.4m hydraulic head.
5. ES-6 includes four individual enhanced swales which have 75mm orifice and weir with 0.5m hydraulic head.
6. ES-7 includes four individual enhanced swales which have 75mm orifice and weir with 0.2m hydraulic head.
7. ES-2 might not be needed, since the proposed uncontrolled flow is smaller than existing allowable flow.

Note:
1. Qp-ex is the allowable flow.
2. Qp-ex-underground is the unit rate flow applied on the drainage area 27.07-TWY-1 where TWY running way going underground.
3. Qp-prop-vo is the controlled proposed peak flow coming from the 27.07-TWY-2 and 27.07-TWY-3.
4. ES-15 includes two individual enhanced swales with 75mm orifice only.
5. ES-16 includes two individual enhanced swales with 75mm orifice only.
6. ES-17 includes seven individual enhanced swales with 75mm orifice only.
7. ES-18 is one enhanced swale with 75mm orifice only.
8. ES-19 includes five individual enhanced swales with 75mm orifice only.

4.2.1.4 WATERCOURSE REALIGNMENT WITHIN TRAINSTWAY R.O.W.

Rainbow Creek between stations 19+300 and 19+500 of the 407 TWY was considered for realignment as the channel is currently in close proximity to the proposed transitway. The Rainbow Creek watershed drains to form two waterways which intersect the proposed transitway at water crossings H5 and H6, which is located East of Martin Grove Road and South of Highway 407. These two waterways converge immediately south of the transitway and continue flowing eastward as the main branch of Rainbow Creek. This creek then connects to the main branch of the Humber River just south of Highway 407 and the proposed water crossing H7, which is located West of Islington Avenue.

The proposed 407 TWY runs near Rainbow Creek between stations 19+300 and 19+500, however, the proposed roadway does not cross the creek as they are parallel to each other. Near station 19+500 the edge of the transitway is approximately 10 m from the bank of channel. **Figure E.17.b** in **Appendix E** shows the floodplain map of this area. The figure shows that the 100-yr floodline reaches an elevation of 137.34 m which encroaches onto the proposed transitway ROW at approximately station 19+450. However, it should be noted that the proposed elevations of the transitway at stations 19+400 and 19+500 are 143.13 m and 143.43 m respectively, which is approximately 6.0 m above the 100-yr floodline.

Therefore, the channel will not need to be realigned with the use of retaining walls; however, a fluvial geomorphology study is recommended at the detailed design stage to study the influence of a retaining wall on the flow characteristics of the creek.

4.2.1.5 ENCLOSED LOW POINTS AND PUMPING

The proposed transitway alignment passes beneath existing roadways in several locations where the transitway will be enclosed. In five (5) of these locations the alignment dips below the existing roadway to meet clearance criteria and thus creates a low point at which roadway drainage will converge. The treatment methodology using enhanced swales cannot be incorporated at these low points since they are enclosed and below ground. These locations were analysed to discern the feasibility of gravity drainage solutions. Pumping is proposed in cases where roadway drainage cannot be conveyed to an outlet by gravity only. **Table 4-5** summarizes the enclosed transitway low points.

Table 4-5: Enclosed Transitway Low Points Potential Discharge Locations

Nearby Feature	Stationing	TWY Elevation	Potential Location to Discharge by Gravity	Pumping Required	Pumping Discharge Location
Hurontario Station	1+078	194.84	-	Yes	Hurontario Station SWMF-1B
Hwy 410	3+670	179.30	-	Yes	Hwy 410 Roadside Ditch
Tomken Rd.	5+130	181.75	Water Crossing E5	No	-
Goreway Station	11+890	169.88	-	Yes	Goreway Station SWMF-4
Hwy 50 Station	14+714	166.44	Humber River	No	-

Table 4-5 shows that of the five enclosed low points, only two of them may drain by gravity, while the other three require pumping. The discussion for each low point is as follows:

- The low point at ST 1+078 has no nearby infrastructure in which it can drain to by gravity; therefore, pumping is proposed at this location, whereby drainage will be treated at SWMF-1B at Hurontario Station.
- The low point at ST 3+370 has no nearby infrastructure in which it can drain to by gravity; therefore, pumping is proposed at this location, whereby drainage will require a treatment facility to meet quality and quantity control requirements.
- The low point at ST 5+130 may drain via. closed conduit downstream of water crossing E5. The outlet would be outside of the transitway ROW to discharge at a suitable elevation downstream along the alignment of the creek. A treatment facility should be designed to provide quantity and quality control
- The low point at ST 11+890 has no nearby infrastructure in which it can drain to by gravity; therefore, pumping is proposed at this location, whereby drainage will be treated at SWMF-4 at Goreway Station.
- The low point at ST 14+714 may discharge to Humber River at water crossing H1 in a closed conduit without issue; however, a treatment facility should be designed to provide quantity and quality control.

4.2.2 Proposed 407 TWY Stations

There are seven (7) stations proposed along the 407 TWY (refer to **Figures 2-1** through **2-3**). The locations include Hurontario St., Dixie Road, Airport Road, Goreway Drive, HWY 50, HWY 27, and Pine Valley Drive. A preliminary hydrologic analysis was completed, using VO2, to determine the volume requirements for the stormwater management facilities. The approach applied in the Existing Condition is similar in approach to the 407 TWY analysis. The TRCA subwatershed was identified in which each station was located. The VO2 input parameters of each specific subwatershed was utilized for the station area. The VO2 modelling has been undertaken primarily utilizing one characteristic area that aggregates each station subcatchments that drains to each proposed SWM facility on the lot. The Post-Development Condition consisted of all stations being modelled as Standhyd assuming TIMP = 90% and XIMP = 50%. The other remaining parameters are consistent with the TRCA hydrologic (VO2) models received. The drainage area maps of all stations area included in **Figures F.1** to **F.7** in **Appendix F**.

Results of the existing and post-development condition hydrologic analysis for each station are summarized in **Tables F-1** to **F-7** provided in **Appendix F**. Modelling Schematics as well as VO2 model output files of each stations are also included in **Appendix F**. The proposed SWM facilities are shown in **Figures F.1** to **F.7** and the design details are shown in **Table 4-7** to **Table 4-35** below. The SWM strategy primarily includes wet ponds with controlled structures consisting of multiple orifices and/or weirs. A hydrologic analysis has been undertaken for each site and modelling results show no increase in post-development peak flows compared to existing levels or allowable unit flow rates. Outlet details for each stormwater management facility are summarized in **Table 4-6**.

Table 4-6: Stormwater Management Facility Outlet Details

SWM Facility	Type	407 TWY Station	Drainage Area (ha)	Water Quality Protection Level	Outlet Characteristic	Street Name	TRCA Tributary Name	Flow/Thermal Regime
SWMF-1A	Wet Pond	Hurontario Station	3.84	Enhanced	Ditch	-	Fletchers Creek	Coldwater - Permanent
SWMF-1B	Wet Pond	Hurontario Station	2.20	Enhanced	Ditch	-	Fletchers Creek	Coldwater - Permanent
SWMF-2A	Wet Pond	Dixie Road Station	4.43	Enhanced	Creek	-	tobicoke Creek(West Branch	Warmwater - Permanent
SWMF-2B	Wet Pond	Dixie Road Station	1.42	Enhanced	Creek	-	tobicoke Creek(West Branch	Warmwater - Permanent
SWMF-3	Wet Pond	Airport Road Station	5.20	Enhanced	Ditch	-	Mimico Creek	Warmwater - Permanent
SWMF-4	Wet Pond	Goreway Drive Station	7.84	Enhanced	Ditch	-	Mimico Creek	Warmwater - Permanent
SWMF-5A	Wet Pond	Hwy 50 Station	3.82	Enhanced	Ditch	-	West Humber River	Warmwater - Permanent
SWMF-5B	Wet Pond	Hwy 50 Station	3.16	Enhanced	Ditch	-	West Humber River	Warmwater - Permanent
SWMF-6A	Wet Pond	Hwy 27 Station	2.29	Enhanced	Open Channel	-	Albion Creek	Warmwater - Intermittent
SWMF-6B	Wet Pond	Hwy 27 Station	2.79	Enhanced	Open Channel	-	Albion Creek	Warmwater - Intermittent
SWMF-7	Wet Pond	Pine Valley Station	6.47	Enhanced	Ditch	-	Humber River	Warmwater - permanent

4.2.2.1 HURONTARIO STATION

Hurontario Street Station has a total catchment area of 7.46 ha. Due to grading constraints, two SWM facilities are proposed for this lot. SWMF-1A will provide quality and quantity control for the northern section of the Station, including the north parking access road, for a total catchment area of 3.84 ha. The southern half of Hurontario Station, including the bus loop, access road, and area 100-TWY-1, 100-TWY-2, 603-TWY-2 of the transitway, a total of 0.64 ha, will be directed to SWMF-1B; a wet pond that will provide quality and quantity control. The drainage area of each SWM facility is summarized in Table 4-7 and Table 4-8.

Table 4-7: Summary of Hurontario Station SWMF-1A Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)
H-1	2.69	2.42
H-2	0.19	0.17
H-3	0.30	0.27
H-4	0.65	0.58
SWMF-1A Drainage Area Total	3.84	3.46
*Assumed 90% imperviousness for developed areas	For an area of 3.84 ha, the 5mm retention volume (TRCA SWM Criteria, 2012) is 192m^3	

Table 4-8: Summary of Hurontario Station SWMF-1B Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)
H-5 (From Transitway)	0.29	0..26
H-6	0.17	0.15
H-7	0.11	0.10
H-8	0.86	0.77
H-9	0.63	0.57
H-10 (From Transitway)	0.13	0.12
H-11 (Unpaved Area)	0.68	
H-12 (Unpaved Area)	0.74	
SWMF-1B Drainage Area Total	2.20	1.98
*Assumed 90% imperviousness for developed areas	For an area of 2.06 ha, the 5mm retention volume (TRCA SWM Criteria, 2012) is 110 m^3	

Development of the station land significantly increases peak flow rates during storm events, as indicated in Table 4-9.

Table 4-9: Comparison of Allowable and Post- Development (Uncontrolled) Release Rates at Hurontario Station (SWMF-1A & 1B Drainage Areas)

12hr AES Return Period	Allowable Release Rates (A = 7.33 ha) EX Q_p	Post-Development Condition Uncontrolled Peak Flow	Increase from Allowable to Post-Development (Uncontrolled) Peak Flow
	(m^3/s)	(m^3/s)	(%)
2-yr	0.213	0.340	59.62%
5-yr	0.322	0.459	42.55%
10-yr	0.396	0.540	36.36%
25-yr	0.492	0.640	30.08%
50-yr	0.564	0.715	26.77%
100-yr	0.637	0.789	23.86%

SWMF-1A is an extended detention wet pond with a total available volume of 4,873 m^3. The permanent pool has a depth of 1.9 m and a volume of 629.72 m^3 for quality control. **Table F.1A-d** in **Appendix F** shows the design parameters of the proposed pond. Details of the outlet structure, as well as the stage-storage, stage-discharge relationships of the pond are included in **Table F.1A-e** in **Appendix F**. **Table F.1A-f** in **Appendix F** shows that the minimum orifice size required to attenuate the 25 mm storm in 48 hr is 75 mm; thus the outlet structure will be equipped with a 75 mm orifice (invert elevation of 200.50m) to provide erosion control and meet the 25 mm storm retention criteria. To provide temperature control prior to discharge to the tributary to Fletchers Creek, which is a Redside Dace temperature sensitive area, the permanent pool has a depth of 1.9m and a preliminary cooling trench is proposed after the pond outlet.

To achieve the quantity control requirements, one orifice and one weir are proposed:

- Orifice #1: Diameter = 300 mm, invert elevation = 200.95 m
- Weir #1: width = 1200 mm, invert elevation = 201.24 m

Storage and discharge characteristics of SWMF-1A are included in **Table 4-10.** Allowable release rates and post-development controlled to allowable peak flows are for the whole drainage area of Hurontario Station.

Table 4-10: Storage and Discharge Characteristics of SWMF-1A

12hr AES Return Period	Allowable Release Rates Existing Conditions Flow Rates $Q_{allowable}$	SWMF-1B CHARACTERISTICS			Decrease Post-Development Controlled to Allowable Peak Flow
		Storage Provided	Storage Required	Release Rate	
	(m^3/s)	(m^3)	(m^3)	(m^3/s)	(%)
2-yr	0.213	3312	685	0.053	-108.82%
5-yr	0.322	3312	905	0.097	-95.15%
10-yr	0.396	3312	1049	0.118	-85.92%
25-yr	0.492	3312	1187	0.195	-57.69%
50-yr	0.564	3312	1271	0.271	-35.58%

100-yr	0.637	3312	1325	0.350	-19.51%

A 525 mm STM outlet pipe is proposed for SWMF-1A. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 1360 mm overflow weir (Height: 0.3m) at the top of the pond serves as an emergency overflow spill for the pond, which can be found in **Table F.1A-i** in **Appendix F.** To provide filtration of large debris, the pond is equipped with a hickenbottom draw pipe connected to the outlet structure. Outlet structure details for SWMF-1A can be found in **Figure F.1** in **Appendix F**.

SWMF-1B is also an extended detention wet pond with a total volume of 2,473 m^3. The permanent pool has an average depth of 1.22 m and a volume of 458 m^3 for quality control. **Table F.1B-d** in **Appendix F** shows the design parameters of the proposed pond. Details of the outlet structure, as well as the stage-storage, stage-discharge relationships of the pond are included in **Table F.1B-e** in **Appendix F**. **Table F.1B-f** in **Appendix F** shows that the minimum orifice size required to attenuate the 25 mm storm in 48 hr is 75 mm; thus the outlet structure will be equipped with a 75 mm orifice (invert elevation of 200.98 m) to provide erosion control and meet the 25 mm storm retention criteria.

To achieve the quantity control requirements, one weir is proposed:

- Weir #1: width = 135 mm, invert elevation = 201.35 m

Storage and discharge characteristics of SWMF-1B are summarized in **Table 4-11.** Allowable release rates and post-development controlled to allowable peak flows are for the whole drainage area of Hurontario Station.

Table 4-11: Storage and Discharge Characteristics of SWMF-1B

12hr AES Return Period	Allowable Release Rates Existing Conditions Flow Rates $Q_{allowable}$	SWMF-1B CHARACTERISTICS			Decrease Post-Development Controlled to Allowable Peak Flow
		Storage Provided	Storage Required	Release Rate	
	(m^3/s)	(m^3)	(m^3)	(m^3/s)	(%)
2-yr	0.213	2156	606	0.014	-108.82%
5-yr	0.322	2156	763	0.025	-95.15%
10-yr	0.396	2156	866	0.034	-85.92%
25-yr	0.492	2156	986	0.047	-57.69%
50-yr	0.564	2156	1072	0.056	-35.58%
100-yr	0.637	2156	1155	0.066	-19.51%

An open channel serving as outlet conveyance is proposed for SWMF-1B (**Table F.1B-h** in **Appendix F**). It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 810 mm overflow weir (Height: 0.3m) at the top of the pond serves as an emergency overflow spill for the pond, which can be found in **Table F.1B-i** in **Appendix F**. To provide filtration of large debris, the pond is equipped with a hickenbottom draw pipe connected to the outlet structure. Outlet structure details for SWMF-1B can be found in **Figure F.1** in **Appendix F**.

4.2.2.2 DIXIE STATION

Dixie Road Station has a total catchment area of 5.85 ha. Two (2) parking lots are proposed at this location, an East and a West lot. Two (2) SWM facilities are proposed for this lot. SWMF-2A (West Station) will provide quality and quantity control for the western section of the Station, including the bus loop, and access road, for a total catchment area of 4.43 ha. The eastern half of Dixie Station, a total of 1.42 ha, will be directed to SWMF-2B; a wet pond that will provide quality and quantity control. The drainage area of each SWM facility is summarized in **Table 4-12** and **Table 4-13**.

Table 4-12: Summary of Dixie Road Station SWMF-2A Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)
D-1	3.8	3.42
D-2	0.3	0.27
D-3	0.33	0.30
SWMF-2A Drainage Area Total	4.43	3.99
*Assumed 90% imperviousness for developed areas	For an area of 4.42 ha, the 5mm retention volume (TRCA SWM Criteria, 2012) is 221 m^3	

Table 4-13: Summary of Dixie Road Station SWMF-2B Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)
D-4	1.42	1.28
SWMF-2B Drainage Area Total	1.42	1.28
*Assumed 90% imperviousness for developed areas	For an area of 1.42 ha, the 5mm retention volume (TRCA SWM Criteria, 2012) is 71 m^3	

Development of the station land significantly increases peak flow rates during storm events, as indicated in

Table 4-14 and **Table 4-15.**

Table 4-14: Comparison of Allowable and Post- Development (Uncontrolled) Release Rates at Dixie Road Station (SWMF-2A Drainage Areas)

50-yr	0.100	0.111	11.34%
100-yr	0.111	0.123	11.07%

SWMF-2A is an extended detention wet pond with a total available volume of 2756 m^3. The permanent pool has an average depth of 1.02 m and a volume of 907 m^3 for quality control. **Table F.2A-d** in **Appendix F** shows the design parameters of the proposed pond. Details of the outlet structure, as well as the stage-storage, stage-discharge relationships of the pond are included in **Table F.2A-e** in **Appendix F**. **Table F.2A-f** in **Appendix F** shows that the minimum orifice size required to attenuate the 25 mm storm in 48 hr is 80 mm; thus the outlet structure will be equipped with a 80mm orifice (invert elevation of 180.18 m) to provide erosion control and meet the 25 mm storm retention criteria.

To achieve the quantity control requirements, one weir is proposed:

- Weir #1: width = 2300 mm, invert elevation = 180.76 m

Storage and discharge characteristics of SWMF-2A are summarized in **Table 4-16.**

Table 4-16: Storage and Discharge Characteristics of SWMF-2A

25-yr	0.277	1825	1191	0.223	-24.22%

50-yr	0.311	1825	1234	0.273	-13.98%
100-yr	0.346	1825	1273	0.319	-8.36%

A 700 mm STM outlet pipe is proposed for SWMF-2A. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 1250 mm overflow weir (Height: 0.3m) at the top of the pond serves as an emergency overflow spill for the pond, which can be found in **Table F.2A-i** in **Appendix F**. To provide filtration of large debris, the pond is equipped with a hickenbottom draw pipe connected to the outlet structure. Outlet structure details for SWMF-2A can be found in **Figure F.2** in **Appendix F**.

SWMF-2B is also an extended detention wet pond with a total available volume of 1,305 m^3. The permanent pool has an average depth of 0.98 m and a volume of 290 m^3 for quality control. **Table F.2B-d** in **Appendix F** shows the design parameters of the proposed pond. Details of the outlet structure, as well as the stage-storage, stage-discharge relationships of the pond are included in **Table F.2B-e** in **Appendix F**. **Table F.2B-f** in **Appendix F** shows that the minimum orifice size required to attenuate the 25 mm storm in 48 hr is 75 mm; thus the outlet structure will be equipped with a 75 mm orifice (invert elevation of 179.42 m) to provide erosion control and meet the 25 mm storm retention criteria.

To achieve the quantity control requirements, one weir is proposed:

- Weir #1: width = 1100 mm, invert elevation = 179.79 m

Storage and discharge characteristics of SWMF-2B are summarized in **Table 4-17.**

Table 4-17: Storage and Discharge Characteristics of SWMF-2B

12hr AES Return Period	Allowable Release Rates Etobicoke Unit Flow Rates $Q_{allowable}$	SWMF-2B CHARACTERISTICS			Decrease Post-Development Controlled to Allowable Peak Flow

10-yr	0.074	1007	352	0.052	-42.55%
25-yr	0.089	1007	370	0.073	-21.58%
50-yr	0.100	1007	383	0.089	-12.02%
100-yr	0.111	1007	397	0.100	-10.75%

A 800 mm STM outlet pipe is proposed for SWMF-2B. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 400 mm overflow weir (Height: 0.3m) at the top of the pond serves as an emergency overflow spill for the pond, which can be found in **Table F.2B-i** in **Appendix F**. To provide filtration of large debris, the pond is equipped with hickenbottom draw pipe connected to the outlet structure. Outlet structure details for SWMF-2B can be found in **Figure F.2** in **Appendix F**.

4.2.2.3 AIRPORT STATION

Airport Station has a total catchment area of 5.20 ha. **Table 4-18** provides a summary of the drainage areas at the station.

Table 4-18: Summary of Airport Road Station SWMF-3 Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)
A-1	0.35	0.32
A-2	4.14	3.73
A-3	0.51	0.46
A-4	0.20	0.18
SWMF-3 Drainage Area Total	5.2	4.68
*Assumed 90% imperviousness for developed areas	For an area of 5.2 ha, the 5mm retention volume (TRCA SWM Criteria, 2012) is 260 m^3	

Development of the station land significantly increases peak flow rates during storm events, as indicated in **Table 4-19**.

Table 4-19: Comparison of Allowable and Post- Development (Uncontrolled) Release Rates at Airport Road Station (SWMF-3 Drainage Areas)

12hr AES Return Period	Allowable Release Rates (A = 5.20 ha) EX Q_p	Post-Development Condition Uncontrolled Peak Flow	Increase from Allowable to Post-Development (Uncontrolled) Peak Flow

50-yr	0.453	0.517	14.13%
100-yr	0.504	0.568	12.70%

SWMF-3 is an extended detention wet pond with a total available volume of 3,816 m^3. The permanent pool has an average depth of 1.03 m and a volume of 1,107 m^3 for quality control. **Table F.3-d** in **Appendix F** shows the design parameters of the proposed pond. Details of the outlet structure, as well as the stage-storage and stage-discharge relationships of the pond are included in **Table F.3-e** in **Appendix F**. **Table F.3-f** in **Appendix F** shows that the minimum orifice size required to attenuate the 25 mm storm in 48 hr is 90 mm; thus the outlet structure will be equipped with a 90 mm orifice (invert elevation of 179.67 m) to provide erosion control and meet the 25 mm storm retention requirements.

To achieve the quantity control requirements, one weir is proposed:

- Weir #1: width = 2200 mm, invert elevation = 180.18 m

Storage and discharge characteristics of SWMF-3 are summarized in **Table 4-20.**

Table 4-20: Storage and Discharge Characteristics of SWMF-3

12hr AES Return Period	Allowable Release Rates Existing Conditions Flow Rates $Q_{allowable}$	SWMF-3 CHARACTERISTICS			Decrease Post-Development Controlled to Allowable Peak Flow

100-yr	0.504	2680	1821	0.485	-3.92%

A 900 mm STM outlet pipe is proposed for SWMF-3. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 1860 mm overflow weir (Height: 0.3m) at the top of the pond serves as an emergency overflow spill for the pond, which can be found in **Table F.3-i** in **Appendix F**. To provide filtration of large debris, the pond is equipped with hickenbottom draw pipe connected to the outlet structure. For outlet structure details of SWMF-3 refer to **Figure F.3** in **Appendix F**.

4.2.2.4 GOREWAY STATION

Goreway Drive Station has a total catchment area of 7.84 ha. **Table 4-21** provides a summary of the drainage areas at the station.

Table 4-21: Summary of Goreway Drive Station SWMF-4 Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)
G-1	4.98	4.48
G-2 (Transitway area)	0.37	0.22

50-yr	0.671	0.759	13.11%
100-yr	0.757	0.837	10.57%

SWMF-4 is an extended detention wet pond with a total available volume of 4,775 m^3. The permanent pool has an average depth of 1.18 m and a volume of 1,495 m^3 for quality control. **Table F.4-d** in **Appendix F** shows the design parameters of the proposed pond. Details of the outlet structure, as well as the stage-storage and stage-discharge relationships of the pond are included in **Table F.4-e** in **Appendix F**. **Table F.4-f** in **Appendix F** shows that the minimum orifice size required to attenuate the 25 mm storm in 48 hr is 95 mm; thus the outlet structure will be equipped with a 95 mm orifice (invert elevation of 173.22 m) to provide erosion control and meet the 25 mm storm retention requirements.

To achieve the quantity control requirements, one weir is proposed:

- Weir #1: width = 2000 mm, invert elevation = 173.84 m

Storage and discharge characteristics of SWMF-4 are summarized in **Table 4-23.**

Table 4-23: Storage and Discharge Characteristics of SWMF-4

100-yr	0.757	3277	2554	0.715	-5.87%

A 1100 mm STM outlet pipe is proposed for SWMF-4. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 2740 mm overflow weir (Height: 0.3m) at the top of the pond serves as an emergency overflow spill for the pond, which can be found in **Table F.4-i** in **Appendix F**. To provide filtration of large debris, the pond is equipped with hickenbottom draw pipe connected to the outlet structure. Outlet structure details for SWMF-4 can be found in **Figure F.4** in **Appendix F**.

4.2.2.5 HWY 50 STATION

HWY 50 station lies in the Sub-Basin 46 in Humber River Watershed where quantity control is not required (Stormwater Management Criteria, TRCA, August 2012), therefore, two stormwater management facilities are proposed only for quality control purpose.

SWMF-5A will provide quality control for the section of the station north of the 407 TWY, including the bus loop and access road, a total catchment area of 4.18 ha. SWMF-5B will provide quality control for the Station south of the 407 TWY, including the station itself and the access road; a total catchment area of 3.16 ha. The drainage areas for each facility are summarized in **Table 4-24** and **Table 4-25** respectively.

Table 4-24: Summary of HWY 50 Station SWMF-5A Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)
H-1	0.47	0.42
H-2	1.43	1.29
H-3 (Pervious area)	1.43	0.42
H-4	0.49	0.44
H-7	0.36	0.32
SWMF-5A Drainage Area Total	2.75	2.48
*Assumed 90% imperviousness for developed areas	For an area of 2.75 ha, the 5mm retention volume (TRCA SWM Criteria, 2012) is 137.5 m^3	

Table 4-25: Summary of HWY 50 Station SWMF-5B Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)
H-5	0.40	0.36
H-6	2.76	2.48
SWMF-5B Drainage Area Total	3.16	2.84
*Assumed 90% imperviousness for developed areas	For an area of 3.16 ha, the 5mm retention volume (TRCA SWM Criteria, 2012) is 158 m^3	

Development of the station land significantly increases peak flow rates during storm events, as indicated in

Table 4-26 and **Table 4-27.**

Table 4-26: Comparison of Allowable and Post- Development (Uncontrolled) Release Rates at HWY 50 Station (SWMF-5A Drainage Areas)

50-yr		1331	1670	0.016	
100-yr		1331	1853	0.017	

A 800 mm STM outlet pipe is proposed for SWMF-5A. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 1810 mm overflow weir (Height: 0.3m) at the top of the pond serves as an emergency overflow spill for the pond, which can be found in **Table F.5A-i** in **Appendix F**. To provide filtration of large debris, the pond is equipped with hickenbottom draw pipe connected to the outlet structure. Outlet structure details are provided in **Figure F.5** in **Appendix F**.

SWMF-5B is also an extended detention wet pond with a total available volume of 2,495 m^3. The permanent pool has an average depth of 1.04 m and a volume of 623 m^3 for quality control. **Table F.5B-d** in **Appendix F** shows the design parameters of the proposed pond. Details of the outlet structure, as well as the stage-storage and stage-discharge relationships of the pond are included in **Table F.5B-e** in **Appendix F**. **Table F.5B-f** in **Appendix F** shows that the minimum orifice size required to attenuate the 25 mm storm in 48 hr is 75 mm; thus the outlet control structure will be equipped with a 75 mm orifice (invert elevation of 175.46 m) to provide erosion control and to meet 25 mm storm retention requirements.

Storage and discharge characteristics of SWMF-5B are summarized in **Table 4-29.**

Table 4-29: Storage and Discharge Characteristics of SWMF-5B

12hr AES Return Period	Allowable Release Rates Existing Condition Flow Rates $Q_{allowable}$	SWMF-5B CHARACTERISTICS			Decrease Post-Development Controlled to Allowable Peak Flow
		Storage Provided	Storage Required	Release Rate	
	(m^3/s)	(m^3)	(m^3)	(m^3/s)	(%)
2-yr	No Quantity Control Required	1845	845	0.009	No Quantity Control Required

50-yr		1845	1913	0.013	
100-yr		1845	2127	0.014	

A 850 mm STM outlet pipe is proposed for SWMF-5B. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 2060 mm overflow weir (Height: 0.3m) at the top of the pond serves as an emergency overflow spill for the pond, which can be found in **Table F.5B-i** in **Appendix F**. To provide filtration of large debris, the pond is equipped with hickenbottom draw pipe connected to the outlet structure. Outlet structure details are provided in **Figure F.5** of **Appendix F**.

4.2.2.6 HWY 27 STATION

In existing conditions, the alignment of Albion Creek passes through HWY 27 Station. This location of the creek is relatively flat and includes a wetland. The proposed station will occupy this land; therefore, Albion Creek is proposed to be realigned and the wetland is proposed to be relocated north of the transitway and south of the Highway 407 off-ramp. Albion Creek is proposed to be realigned as shown in **Figure F.6** in **Appendix F**. The creek is proposed to be open in a V open channel within the HWY 27 station area after the proposed culvert structure (5m x 2m), which will outlet at the existing culvert found north of Steeles Ave. W., for a total length of 132.5 m.

HWY 27 station lies in the Sub-Basin 46 in Humber River Watershed where quantity control is not required (Stormwater Management Criteria, TRCA, August 2012), therefore, two stormwater management facilities are proposed only for quality control purpose. HWY 27 Station has a total catchment area of 5.09 ha. The proposed grading of the station resembles existing drainage patterns in which runoff drains toward the middle of the station. Therefore, the total station area was divided into its western and eastern parts. The areas of subdivided catchments are 2.8 ha; thus, two identical SWM facilities are proposed on either side of the drainage outlet at the middle of the station. 2.8 ha was used in the station SWM analysis for each wet pond design with 90% imperviousness. The drainage area of each SWM facility is summarized in **Table 4-30**.

Table 4-30: Summary of HWY 27 Station SWMF-6 Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)
H-1 (West)	2.29	2.1
H-2 (East)	2.80	2.52
SWMF-6 Drainage Area Total	5.09	4.62
*Assumed 90% imperviousness for developed areas	For an area 5.60 of ha, the 5mm retention volume (TRCA SWM Criteria, 2012) is 255 m^3	

Development of the station land significantly increases peak flow rates during storm events, as indicated in

Table 4-31.

Table 4-31: Comparison of Allowable and Post- Development (Uncontrolled) Release Rates at HWY27 Station (SWMF-6 Drainage Areas)

12hr AES Return Period	Allowable Release Rates (A = 2.8 ha) EX Q_p	Post-Development Condition Uncontrolled Peak Flow	Increase from Allowable to Post-Development (Uncontrolled) Peak Flow

10-yr		0.383	

25-yr		0.455	No Quantity Control Required
50-yr		0.509	
100-yr		0.562	

SWMF-6 is an extended detention wet pond with a total available volume of 1,684 m³. The permanent pool has an average depth of 0.88 m and a volume of 563 m³ for quality control. **Table F.6-d** in **Appendix F** shows the design parameters of the proposed pond. Details of the outlet structure, as well as stage-storage and stage-discharge relationships of the pond are included in **Table F.6-e** in **Appendix F**. **Table F.6-f** in **Appendix F** shows that the minimum orifice size required to attenuate the 25 mm storm in 48 hr is 75 mm; thus the outlet control structure will be equipped with a 75 mm orifice (invert elevation of 172.42 m) to provide erosion control and meet the 25 mm storm retention criteria.

Storage and discharge characteristics of SWMF-6 are summarized in **Table 4-32.**

Table 4-32: Storage and Discharge Characteristics of SWMF-6

12hr AES Return Period	Allowable Release Rates Existing Conditions Flow Rates $Q_{allowable}$	SWMF-6 CHARACTERISTICS			Decrease Post-Development Controlled to Allowable Peak Flow
		Storage Provided	Storage Required	Release Rate	
	(m^3/s)	(m^3)	(m^3)	(m^3/s)	(%)
2-yr	o Quantity Control Required	1097	748	0.010	No Quantity Control Required

50-yr		1097	1690	0.015	
100-yr		1097	1877	0.016	

A 800 mm STM outlet pipe is proposed for SWMF-6. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 1840 mm overflow weir (Height: 0.3m) at the top of the pond serves as an emergency overflow spill for the pond, which can be found in **Table F.6-i** in **Appendix F**. To provide filtration of large debris, the pond is equipped with hickenbottom draw pipe connected to the outlet structure. Outlet structure details can be found in **Figure F.6** in **Appendix F**.

4.2.2.7 PINEVALLEY STATION

Pine Valley has a total catchment area of 6.47 ha. **Table 4-33** provides a summary of the drainage areas at this station. runoff from the access road leading to the transitway on the eastern side of the station will drain toward the transitway and be treated as part of the roadway drainage design.

Table 4-33: Summary of Pinevalley Station SWMF-7 Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)
P-1	0.94	0.85
P-2	0.47	0.42
P-3	4.66	4.19
P-4	0.40	0.36
SWMF-7 Drainage Area Total	6.47	5.82
*Assumed 90% imperviousness for developed areas	For an area of 6.47 ha, the 5mm retention volume (TRCA SWM Criteria, 2012) is 323.5 m^3	

Development of the station land significantly increases peak flow rates during storm events, as indicated in **Table 4-34**.

Table 4-34: Comparison of Allowable and Post- Development (Uncontrolled) Release Rates Pinevalley Station (SWMF-7 Drainage Areas)

12hr AES Return Period	Allowable Release Rates (A = 6.47 ha) EX Q_p	Post-Development Condition Uncontrolled Peak Flow	Increase from Allowable to Post-Development (Uncontrolled) Peak Flow
	(m^3/s)	(m^3/s)	(%)

10-yr	0.074	0.855	1062.13%
25-yr	0.092	1.023	1011.49%
50-yr	0.107	1.148	976.66%
100-yr	0.121	1.272	947.94%

SWMF-7 is an extended detention wet pond with a total available volume of 6,536 m^3. The permanent pool has an average depth of 1.76 m and a volume of 1,087 m^3 for quality control. **Table F.7-d** in **Appendix F** shows the design parameters of the proposed pond. Details of the outlet structure, as well as stage-storage and stage-discharge relationships of the pond are included in **Table F.7-e** in **Appendix F**. **Table F.7-f** in **Appendix F** shows that the minimum orifice size required to

attenuate the 25 mm storm in 48 hr is 92 mm; thus the outlet control structure will be equipped with a 92 mm orifice (invert elevation of 157.74 m) to provide erosion control and meet 25 mm storm retention criteria.

To achieve the quantity control requirements, one weir is proposed:

- Weir #1: width = 70 mm, invert elevation = 158.25 m

Storage and discharge characteristics of SWMF-7 are summarized in **Table 4-35.**

Table 4-35: Storage and Discharge Characteristics of SWMF-7

A 1200 mm STM outlet pipe is proposed for SWMF-7. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 4170 mm overflow weir (Height: 0.3m) at the top of the pond serves as an emergency overflow spill for the pond, which can be found in **Table F.7-i** in **Appendix F**. To provide filtration of large debris, the pond is equipped with hickenbottom draw pipe connected to the outlet structure. Outlet structure details are provided in **Figure F.7** in **Appendix F**.

5 Erosion and Sediment Control During Construction

The erosion and sediment control (ESC) practices to be developed during detailed design should follow the latest MTO's reference documents including the Environmental Reference for Highway Design (MTO, June 2013), the Environmental Guide for Erosion and Sediment Control during Construction of Highway Projects (MTO, September 2015), as well as the Ontario Provincial Standards for Roads and Public Works (OPSS), and the Erosion and Sediment Control Guidelines for Urban Construction (Golden Horseshoe, Dec 2006).

Impacts on the surrounding environment related to highway projects can be mitigated by proper erosion and sediment control measures. MTO

It is recommended that a multi-barrier approach be undertaken during construction using the following measures as a minimum:

- Stabilize exposed soils with vegetation where possible to reduce the amount of sediments that would be conveyed further downstream to existing watercourses;
- Implement construction phasing to limit the duration of soil exposure;
- Install heavy-duty double silt fence at each water crossing;
- Double silt fence to be supported by straw-bale;
- Install rock check dams to reduce high flow velocities in the ditches/swales adjacent to the proposed 407 TWY;
- Erosion and sediment control blankets for the road embankments;
- Dewatering, temporary channel diversions; and
- Use erosion prevention controls and sediment control measures as necessary

6 Conclusions and Considerations

1. Due to the road profile sloping underground, pumping may be required at three locations along the proposed 407 TWY: Hurontario Station (ST 1+078), Highway 410 (ST 3+670), Goreway Station (11+890). Details related to pump sizes should be provided during detailed design.
2. A treatment train approach is proposed for the TWY corridor consisting of grass embankments, long grassed swales, and enhanced swales. Quantity control of transit flows is proposed to be provided through enhanced swales. These were designed as dry ponds with a formal outlet control structure consisting of 100 mm perforated pipe, hickenbottom structure and a 75 mm orifice plate. A single typical enhanced swale design was used throughout the roadway drainage analysis however a more detailed analysis should be undertaken during detailed design.
3. The SWM strategy for the stations include wet ponds with control structures consisting of multiple orifices and/or weirs. Wet ponds were designed for each station to provide quantity, quality, and erosion and sediment control. All of the stormwater management facilities meet MOECC and MTO criteria.
4. The Hydraulic analysis was undertaken using HEC-RAS, and in some cases HY-8, for 22 crossings within the study limits. TRCA provided 5 HEC-RAS models, while Parsons created the models for the remaining crossings. HY-8 was used for the preliminary analysis of water crossings H5. Further investigation is recommended for the following water crossings:
    a. The analysis undertaken for H2 excluded existing conditions as ongoing construction at the 407 Patrol Yard is in the process of realigning Albion Creek.
    b. The analysis undertaken for H5 used water levels generated from the TRCA model as inputs into an HY-8 model. It is recommended to conduct a field investigation during detail design to confirm the inlet properties of the existing 1.0 m dia. culvert, and to refine the hydraulic model at the flow split between the existing 1.0 m dia. Culvert and the large channel flowing from west to east located north of Highway 407.
    c. The analysis undertaken for H8 used a worst-case scenario assuming all runoff from 350 ha of upstream drainage area drains toward this crossing. Quantification and modelling of the Aviva Park Pond and other existing SWM controls in the area could reduce the amount of flow leading to H8. Additionally, the feasibility of dredging in this area should be analyzed at a future stage.
5. The results of the hydraulic analysis show that water levels increase from existing conditions to proposed conditions at most proposed crossings; however, these increases are confined within MTO's ROW and have no impacts on upstream nor downstream riparian and private properties.
6. All structures meet MTO's design criteria with regards to freeboard and clearances with two exceptions, proposed structure for M7 and proposed structure for H8.

    Further analysis is recommended to be undertaken for the M7 crossing since the proposed TWY provides the largest span compared to all structures along M7 near the proposed TWY. The comparison of existing and

proposed water levels show no increases upstream of the existing Highway 407 and downstream of the 407 TWY. Increases are noted only on the first section upstream of the TWY and they are localized.

In regards to crossing for H8, the 407 TWY profile at this location has been raised providing the highest elevation possible at this location, considering the transmission cables.

7. Rainbow Creek runs parallel to the proposed transitway between stations 19+300 and 19+500 of the 407 TWY and was considered for realignment due to its proximity to the transitway. Realignment was avoided with the use of retaining walls; however, a fluvial geomorphology study is recommended in the detailed design stage to study the flow characteristics of this location further.

Field Investigation - April, 2017

PARSONS

Inspection Notes – C1

INLET:

- Site cannot be seen or accessed. A tall fence close to site C2 may provide access to this site however the gate is locked.

OUTLET:

- Site cannot be accessed because of a fence on the South side however, a pond access road (from Hwy 407 near Exit 44) can be used to get to this area. See photo C1-01.

PHOTOS:

PARSONS

Inspection Notes – C2

INLET/OUTLET:

- Accessed from walking trail off Meadowlark Drive.
- 2 bridges, 2 spans each (each span is 50 m wide).
- For scaling reference:
    - SW corner of bridges, abutment height = 2 m
    - NW corner of bridges, abutment height = 3.3 m

PHOTOS:

PARSONS

Inspection Notes – C3

INLET:

- Site cannot be seen or accessed. A tall fence close to site C2 may provide access to this site however the gate is locked.

OUTLET:

- Site cannot be accessed because of a fence on the South side however, a pond access road (from Hwy 407) can be used to get to this area. See photo C3-01.

PHOTOS:

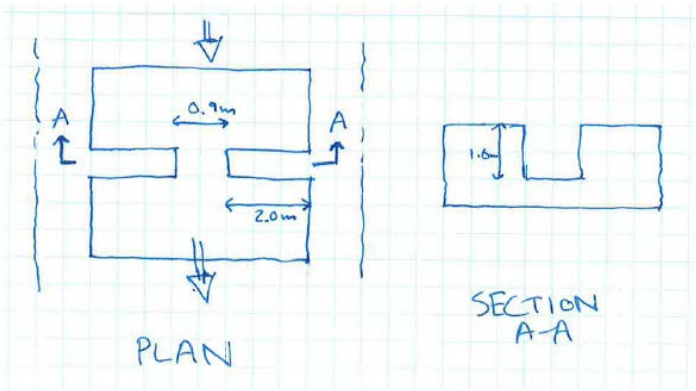
PARSONS

Inspection Notes – E1

INLET:

- Site accessed by climbing short fence on Havelock Drive.
- Box culvert with >1.5 m cover.
- Wetland area ~100 m U/S of Inlet with rip-rap spillway (see photos E1-04 and E1-05).

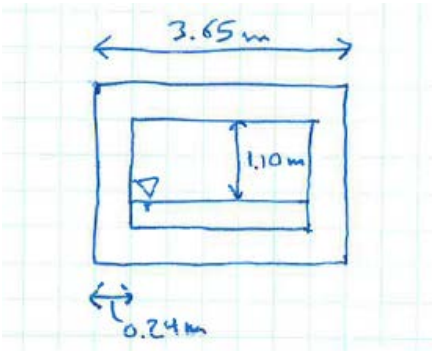
SKETCH OF WETLAND SPILLWAY:



OUTLET:

- Site accessed from Hurontario / Hwy 407 Park & Ride.
- Box culvert with > 2 m cover.

SKETCH OF BOX CULVERT:



PHOTOS:

PARSONS

Inspection Notes – E2

INLET:

- Access from residential private property on SW corner of Hwy 407 / Kennedy Road
- Water depth ~ 0.1 m (after rainfall on previous day)
- CSP culvert (1400 mm dia.), >4 m of cover

OUTLET:

- Access road from Kennedy Road leads directly to culvert
- Water depth ~ 0.5 m (after rainfall on previous day)
- CSP culvert (1400 mm dia.), 0.7 m of cover

~200 M DOWNSTREAM OF OUTLET CROSSING GRAVEL ACCESS ROAD:

- CSP culvert (0.4 dia), 0.1 m cover
- Ponding on upstream side of culvert

PHOTOS:

PARSONS

Inspection Notes – E3

INLET:

- Access Road off Kennedy Road
- Heavy vegetation at inlet
- Box culvert (see sketch below)

OUTLET:

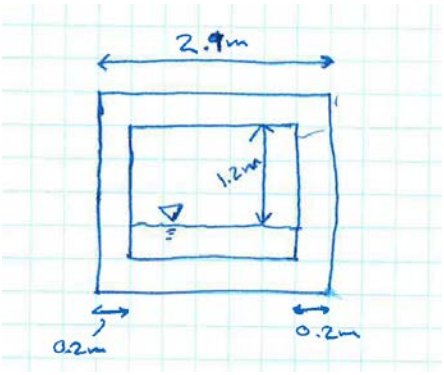
- Access Road off Kennedy Road, close to culvert
- Climbed short fence to get to culvert (see E3-06)
- Heavy vegetation at outlet
- Box culvert (see sketch below)

~350 M DOWNSTREAM OF OUTLET CROSSING GRAVEL ACCESS ROAD:

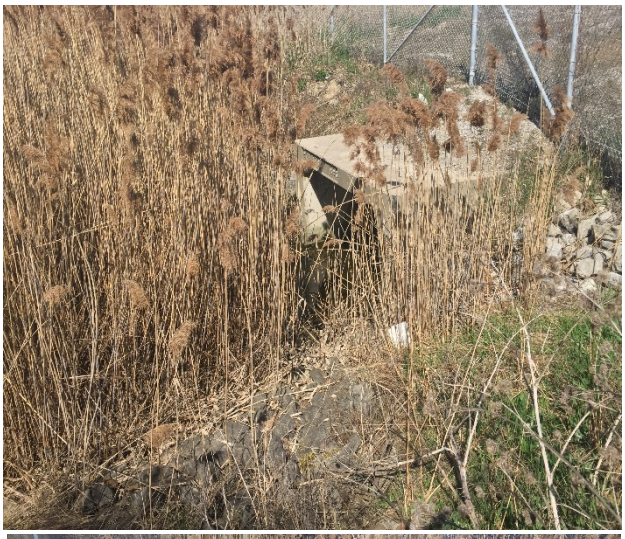
- 0.4 m dia CSP culvert with 0.1 m cover

SKETCH:

- Elevation difference from water level to soffit – Inlet = 1.2 m (dry day)
- Elevation difference from water level to soffit – Outlet = 0.6 m (after rainy day)



PHOTOS:



PARSONS

Inspection Notes – E4

INLET:

- No access - Middle of 407 Ramps

OUTLET:

- No access – blocked by fence
- Very low visibility of culvert – heavy vegetation
- Smooth steel pipe culvert

~30 M DOWNSTREAM OF OUTLET:

- Rip rap erosion protection

~40 M DOWNSTREAM OF OUTLET:

- Wetland zone with rip-rap spillway

~70 M DOWNSTREAM OF OUTLET CROSSING GRAVEL ACCESS ROAD:

- Twin CSP culvert (0.45 mm dia. each), 0.2 m cover

PHOTOS:

PARSONS

Inspection Notes – Culvert ~100 m West of E4

INLET:

- No access - Middle of 407 Ramps

OUTLET:

- No access – blocked by fence
- No visibility of culvert – heavy vegetation

~200 M DOWNSTREAM OF OUTLET CROSSING GRAVEL ACCESS ROAD:

- Twin CSP culverts (~900 mm dia. each), 0.3 m cover

PHOTOS:

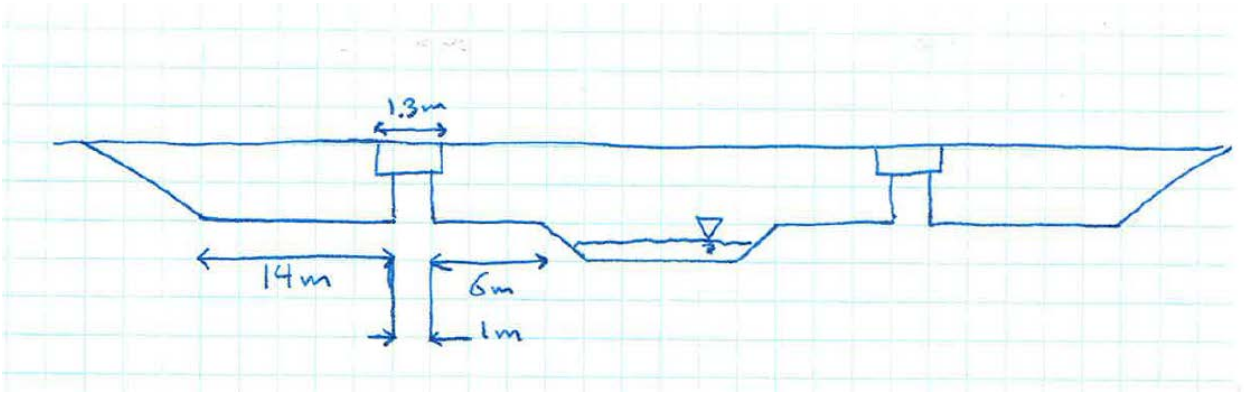
PARSONS

Inspection Notes – E5

INLET/OUTLET:

- 3 bridges with 3 spans each
- Bridge widths as follows:
  - South bridge – 31 m wide
  - Middle bridge – 26 m wide
  - North bridge – 17 m wide

SKETCH (LOOKING UPSTREAM):



PHOTOS:

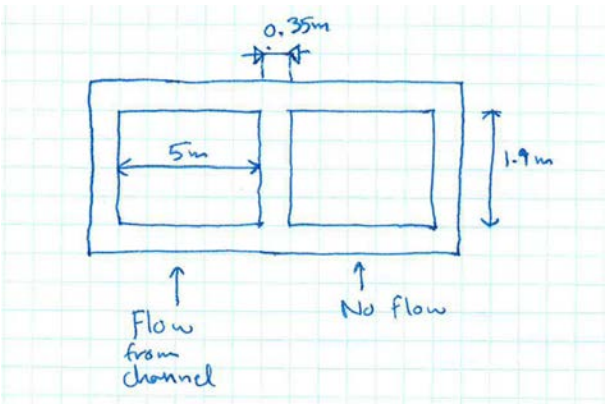
PARSONS

Inspection Notes – E6

INLET/OUTLET:

- Inlet access from parking lot just North of site
- Outlet access from service road off Dixie Road
- Concrete twin box culvert
- No flow through Western side of culvert due to ground obstructions at inlet

SKETCH OF E6 STRUCTURE (AT INLET, LOOKING SOUTH):



~350 M DOWNSTREAM OF OUTLET CROSSING DIXIE ROAD:

PARSONS

Inspection Notes – M2

INLET:

- Culvert inlet is in Canadian Tire property (permission required)

OUTLET:

- Culvert could not be accessed and measured because of tall fence

PHOTOS:

PARSONS

Inspection Notes – M3

INLET:

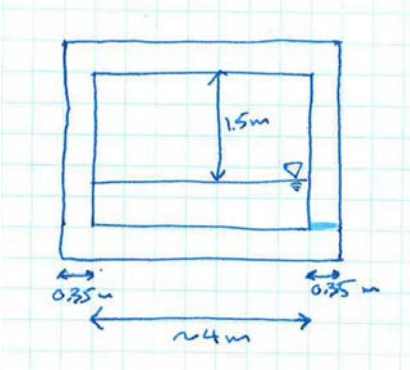
- Access from parking lot off Melanie Drive
- Concrete box culvert

OUTLET:

- Inaccessible due to heavy vegetation and fences
- Barely visible due to heavy vegetation
- Access is from Hwy 407 fence gate

SKETCH:

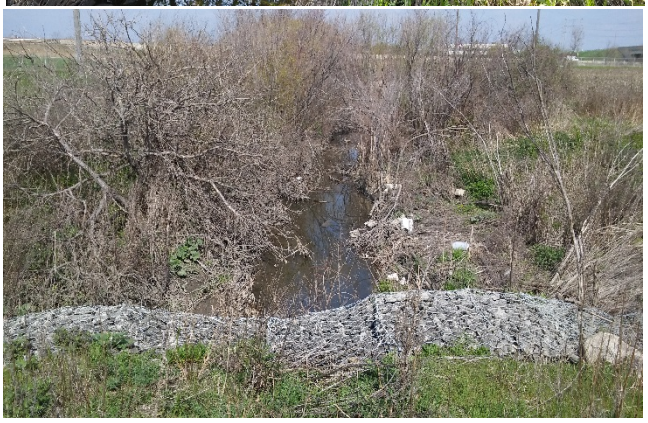
- Elevation difference between water level and soffit – Inlet = 1.5 m



~120 M D/S OF OUTLET CROSSING GRAVEL ROAD:

- Twin CSP culverts (0.5 m dia. each), ~0.5 m cover

PHOTOS:



PARSONS

Inspection Notes – M4

INLET:

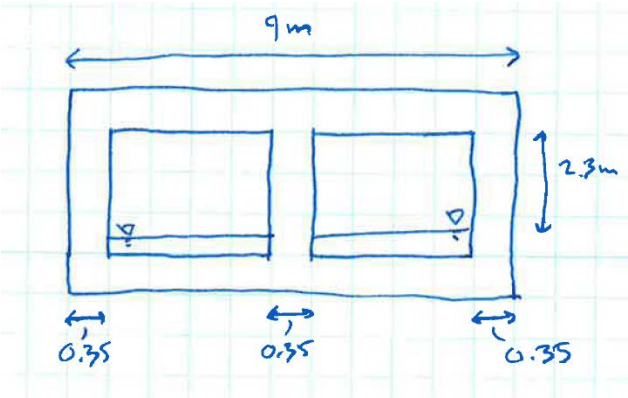
- Access from plaza parking lot (SE corner of Steeles Avenue and Torbram Road)
- Concrete twin box culvert with >1 m of cover
- Another concrete twin box culvert just ~15 m upstream (crossing Steeles Avenue)

OUTLET:

- Access from Waste Management Facility Parking Lot
- Concrete twin box culvert with >1 m of cover

SKETCH:

- Elevation difference between water level and soffit – Outlet = 2.3 m



~100 M D/S OF OUTLET CROSSING GRAVEL ROAD:

- Multiple culverts for crossing gravel road (see photo M4-04)

PHOTS:

PARSONS

Inspection Notes – M5

INLET:

- Inaccessible: Need permission to enter CN property

OUTLET:

- Inaccessible due to heavy vegetation and fences
- Barely visible due to heavy vegetation

PHOTOS:

PARSONS

Inspection Notes – M6

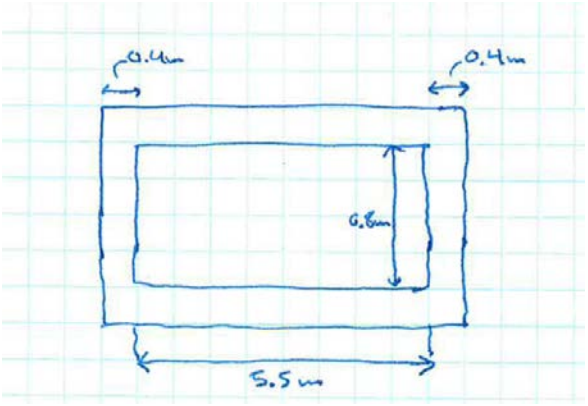
INLET:

- Inlet of culvert is on CN Property which cannot be accessed with permission

OUTLET:

- Access from Flea Market parking lot
- Concrete box culvert with >1 m of cover

SKETCH:



~100 M D/S OF OUTLET CROSSING RAILWAY TRACKS:

- Twin CSP culverts (3.6 m dia. each), > 4 m of cover

PHOTOS:

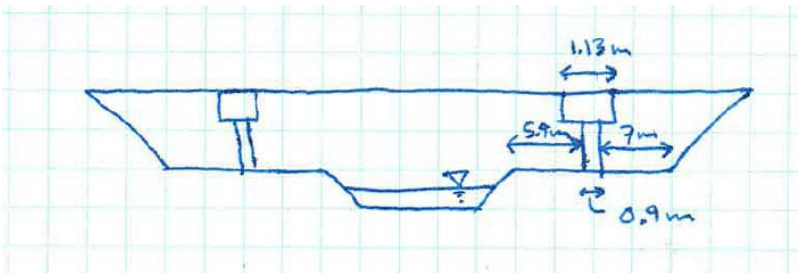
PARSONS

Inspection Notes – M7

INLET/OUTLET:

- Access from Intermodal Drive however, a long walk through dense vegetation is required
- 2 bridges with 3 spans each, channel passes underneath middle span
- Westbound bridge width = 28 m
- Eastbound bridge width = 24.8 m

SKETCH:



PHOTOS:

PARSONS

Inspection Notes – M8

INLET:

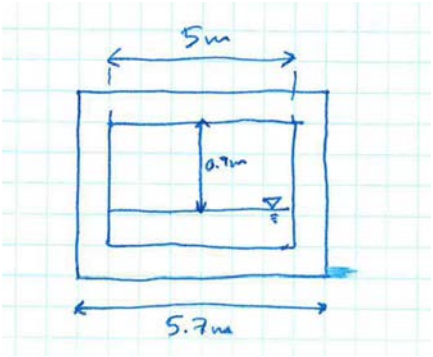
- Inaccessible due to tall fence
- Barely visible due to heavy vegetation

OUTLET:

- Access from private property on Steeles Avenue
- Concrete twin box culvert, >2 m of cover
- Measurements could not be taken without going into the stream

~130 M D/S OF OUTLET CROSSING STEELES AVENUE:

- Concrete box culvert with 0.3 m of cover
- Elevation difference between water level and soffit – Outlet = 0.9 m (2 days after rainfall)



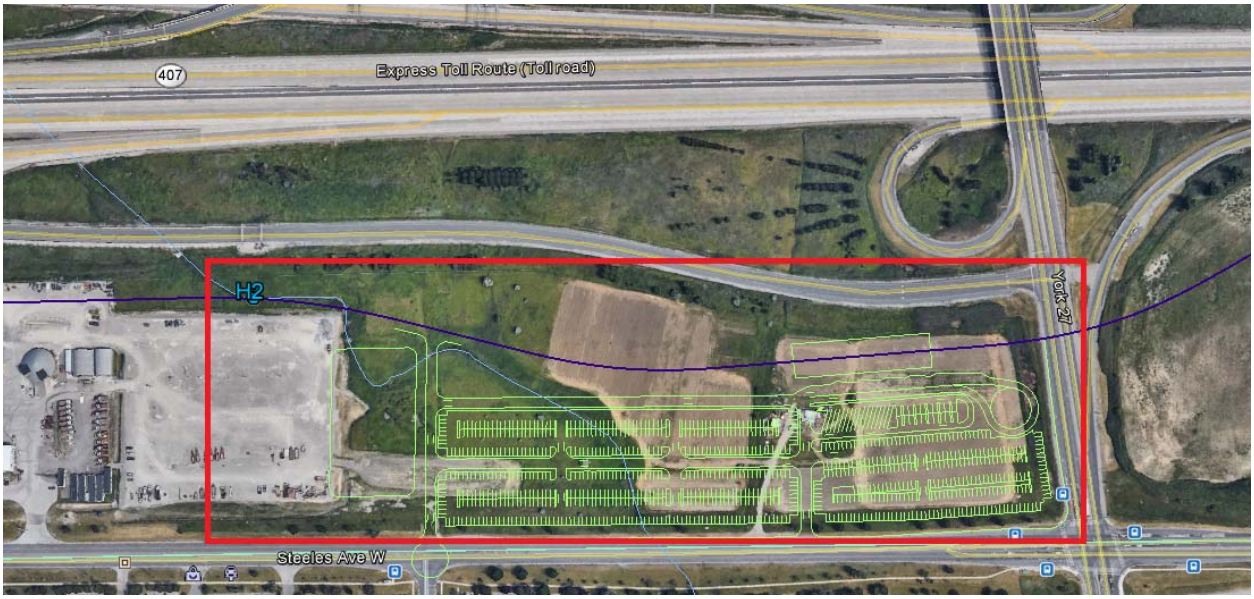
PHOTOS:

Field Investigation - September, 2017

Inspection Notes - Highway 27 Station/H2

This field investigation was conducted on September 7, 2017 at the proposed Highway 27 Station and water crossing H2. The purpose of this investigation was to:

- Determine the creek alignment downstream of the 407 ETR and compare it to satellite images
- Inspect the culvert on the North side of Steeles Avenue West and find outlet
- Determine flow direction of ditch on the North Side of Steeles Avenue West
- Inspect the North-West side of the intersection of Steeles and Highway 27



September 7, 2017 Field Investigation Study Area

407 ETR OFF-RAMP OUTLET

- Concrete Box Culvert H = 1.5 m, W = 4.0 m
- Creek flowing in dry weather
- Creek was under construction
    - Surrounded by silt fence barriers, workers were inspecting newly planted trees/bushes
    - Realigned due to construction of the 407 ETR Patrol Yard Expansion

Photos

NEWLY CONSTRUCTED BRIDGE/BOX STRUCTURE

- Concrete box structure H = 2.0 m, W = 12.0 m, L = 24.0 m
- Newly constructed, not picked up on satellite photos from Google Earth
- Creek alignment has been altered to pass under beneath this structure
- Crossing intended to grant 407 ETR maintenance vehicle easier access to the 407 ETR by merging onto the off-ramp of the 407 and then crossing Highway 27 where they can merge onto the 407 on-ramp.

Photos

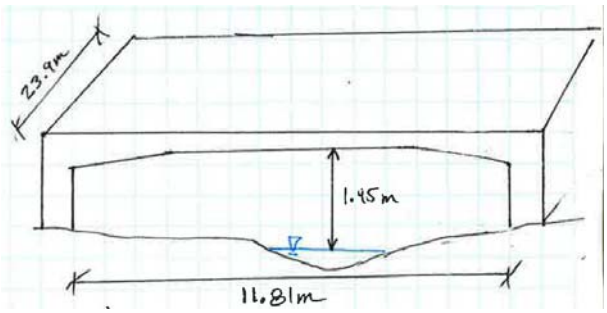
APPROXIMATE BRIDGE LOCATION
APPROXIMATE CREEK REALIGNMENT
H2
York 27
Steeles Ave W

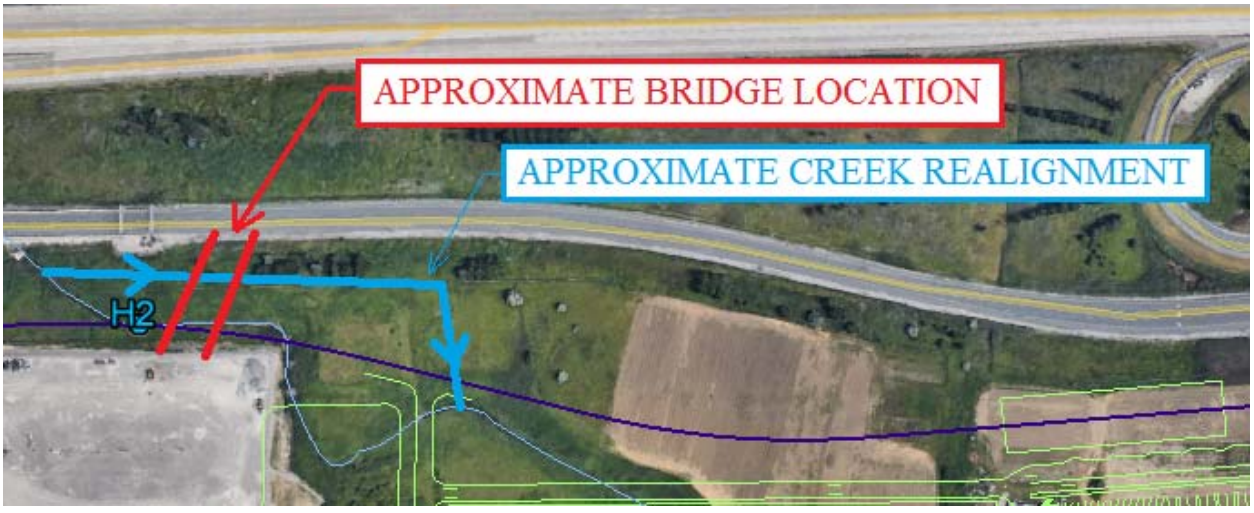


23.9m
1.45m
11.81m

CREEK REALIGNMENT

- Albion Creek has been realigned as part of the construction of the 407 ETR Patrol Yard Expansion. The alignment has moved north of its original position where it reconnects to the existing creek after bending around a newly paved road on the North-East corner of the Patrol Yard site
- Creek flowing in dry weather
- Creek was currently under construction
    - Surrounded by silt fence barriers, workers were inspecting newly planted trees/bushes

Photos



407 ETR PATROL YARD CONSTRUCTION

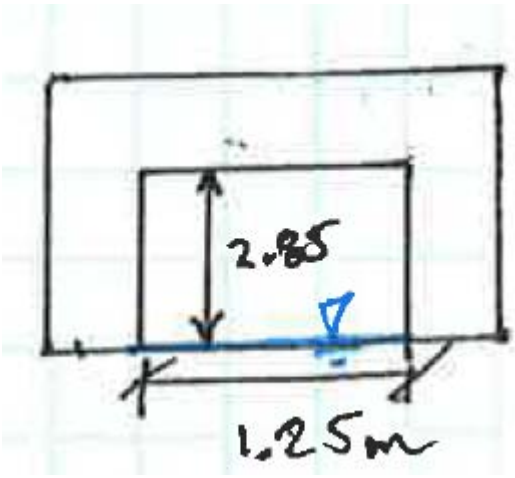
- Construction on site appears to encroach onto 407 TWY property and the proposed SWM Area
    - It was later confirmed that what is being built is temporary and will be replaced upon the construction of the 407 TWY.
- The proposed road on the Western side of the proposed Highway 27 Station has been constructed by the 407 ETR in the same position as drawn in the proposed Highway 27 Station plan.
- Temporary sediment pond noted on Eastern side of Patrol Yard Site

Photos

ALBION CREEK CULVERT ON NORTH SIDE OF STEELES

- Concrete box culvert H = 2.85 m, W = 1.25 m, L = Unknown (Culvert continues enclosed downstream)
- Ditching on North Side of Steeles Avenue West noted to flow towards this culvert from both East and West
- Wetland upstream of culvert

Photos



NORTH-WEST DITCH AT INTERSECTION OF STEELES AND HWY 27

- Ø 1.0 m fiber-reinforces plastic culvert observed
- Ditching North of 407 ETR conveys flows from highway to this culvert

Photos

Inspection Notes – H8

This site was inspected at part of the field investigation that was conducted on September 14, 2017 to examine the drainage characteristics of the area contributing flows to water crossing H8, and to confirm the presence of a culvert on the 407 ETR. The purpose of this site visit was to:

- Inspect the wet pond north of crossing H8 and to determine inlet and outlet locations as well as the inlet origins
- Confirm the presence of a ø 1.0m culvert at the 407 ETR
- Determine drainage patterns and flow direction of ditch North of the 407 ETR

September 14, 2017 Field Investigation Study Area – H8

POND INLET SOUTH-EAST SIDE

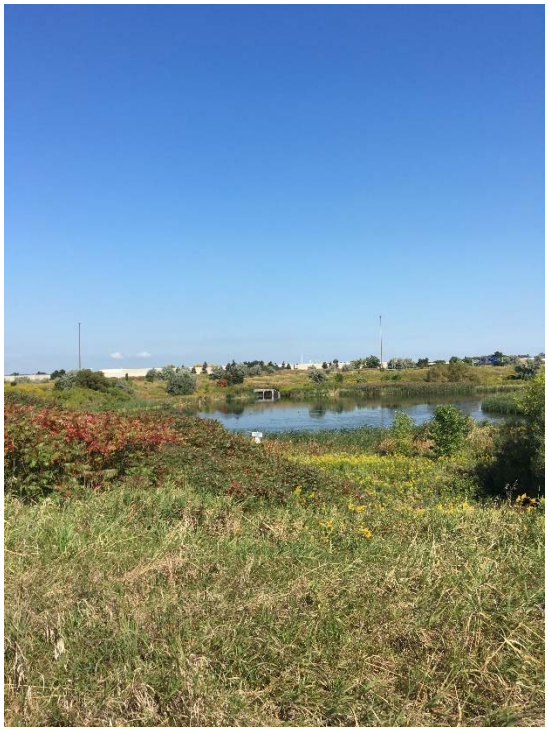
- Inlet located on South-East side of Aviva Park Pond (Vaughan City Pond #80)
- Concrete pipe ø 1.85 m conveys flow coming from the East from the Aviva Park development
- Concrete Headwall top width = 2.50 m, bottom width = 4.0 m, wingwall length = 3.50 m
- Dry weather had very small flow ~2.0 mm depth
- Some debris caught on metal grate fixed at the end of the pipe

Photos

POND INLET NORTH SIDE

- Inlet located on North side of Aviva Park Pond (Vaughan City Pond #80)
- Concrete twin culverts. Unable to measure dimensions due to high water level
- Concrete headwall top width = 7.50 m, wingwall length ~ 7.5 m
- Origin of flows unknown though it is suspected that it comes from industrial development north of the 407 ETR

Photos



POND OUTLET

- Concrete outlet structure located on the South side of Aviva Park Pond (Vaughan City Pond #80)
- Could not take measurements of structure due to high water level and lack of proper equipment (ladders)
- Pond outlets to the creek upstream of H8 where the water level is significantly high leaving the outlet conduit almost at full capacity
- Debris covering the metal grate on inlet of structure and outlet

Photos

407 ETR CULVERT

- Ø1.0m culvert observed
- Culvert was more than half full in dry weather flow conditions
- Culvert drains south into wetland area south of the 407 ETR

Photos

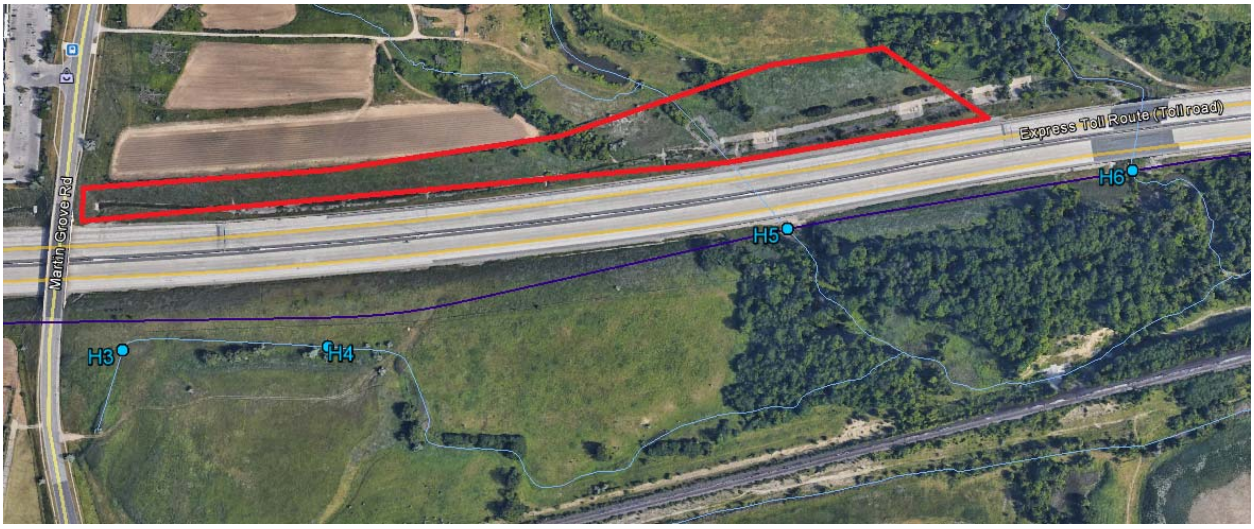
CONSTRUCTION SITE

- Construction ongoing in area South-East of pond and North of Creek
- Land use will become paved and hydrologic models should be update to reflect this

Photos

Inspection Notes – H5

This site was inspected at part of the field investigation that was conducted on September 14, 2017 to examine the drainage characteristics of the area contributing flows to water crossing H5, and to confirm the presence of a ø 1.0 m culvert on the 407 ETR.



September 14, 2017 Field Investigation Study Area – H5

CHANNEL NORTH OF 407 ETR

- Could not access upstream of crossing H5 on the North side of the 407 ETR
    - Gate locked, 407 ETR Patrol would be required to park on the shoulder of the 407 ETR
    - Did not confirm the presence of ø 1.0 m culvert at H5 on the 407 ETR
- Large channel observed to run Eastward toward H5. Later confirmed using satellite imagery that this channel continues past H5 toward H6. However, there is a split where some water will be taken by the ø 1.0 m culvert at H5 before continue on to H6.
