1. INTRODUCTION

1.1. Background and Project Description

Parsons was retained by the Ministry of Transportation Ontario (MTO) to undertake a drainage study in support of an Environmental Progress Report for the proposed 407 Transitway between Kennedy Road and Brock Road (407 TWY), a total distance of approximately 20.2km. Five stations are proposed along the study limits at the following locations: Markham Road, Ninth Line, Donald Cousens Parkway, Whites Road and Brock Road.

The proposed Transitway (407TWY) runs parallel to and to the south of the 407 Express Toll Route (407 ETR) from Kennedy Road in the City of Markham to east of Brock Road interchange in the City of Pickering. Refer to Figure 1.1 for Study Area Map. The proposed 407 TWY falls under Toronto and Region Conservation Authority (TRCA) jurisdiction and crosses three watersheds: Rouge River, Petticoat Creek and Duffins Creek. The study area within Rouge River and Petticoat Creek watersheds is predominantly located in an urban environment, however the section located within Duffins Creek is mainly rural, with significant development underway in the upcoming years. The length of the proposed transitway within the study limits is approximately 20.2 km and five (5) stations and additional parking lots are proposed at Markham Road, Ninth Line, Donald Cousens Parkway, Whites Road and Brock Road.

The present study focuses on the development of a drainage and stormwater management plan for the proposed transitway that minimizes impacts on the existing watercourses and drainage patterns. Hydrologic and hydraulic analysis have been undertaken for the proposed water crossings and mitigation measures are recommended where necessary. The proposed transitway crosses forty-nine (49) watercourses, out of which twenty-three (23) are major branches of creeks (such as Lower Rouge, Little Rouge, West Duffins Creek, Brougham Creek and others) and their tributaries. The remaining watercourses were identified as minor conveyance features with small localized tributary areas that the proposed TWY will not impact because of grade difference.

1.2. Objectives and Scope of Work

The objectives of this study are as follows:

- develop a drainage and stormwater management plan for the proposed 407 TWY that minimizes impact on the existing watercourses and drainage system;
- undertake a hydrologic and hydraulic analysis of the proposed water crossings; and
- provide mitigation measures where necessary.

	SCALE: NTS			FIGURE 1.1 - STUDY AREA MAP (4 of 4)

This study includes the following:

- hydrologic analysis of the proposed transitway to assess any negative impacts on the existing watercourses;
- identifying possible measures to minimize stormwater runoff impacts to fisheries, surface water, groundwater and wetlands;
- design of SWM ponds for each station site to provide quantity and/or quality control;
- updating existing HEC-RAS models provided by TRCA to establish base models that could be used to assess the impact of the proposed 407 TWY;
- created new HEC-RAS models from scratch for water crossings that are not included in the TRCA hydraulic models found within the study area;
- hydraulic analysis of proposed 407 TWY structures;
- review and update of existing floodplain mapping within the study area received from TRCA to include the proposed 407 TWY to ensure no increases in water levels are expected beyond the MTO property.
- create new floodplain maps within the study limits for all creek crossings analyzed.

This report is intended to illustrate how the drainage system is affected by the proposed TWY and to identify possible mitigation measures required to ensure the stormwater management criteria can be met. In addition, a preliminary hydrologic model has been developed to calculate the storage requirements of stormwater management facilities to ensure MOECC's and TRCA's quality and quantity control criteria are achieved for each watershed.

2. EXISTING ENVIRONMENT CHARACTERIZATION

2.1. Water Crossings

The study area crosses three (3) major watersheds governed by the Toronto and Region Conservation Authority (TRCA) - the Rouge River, Petticoat Creek and Duffins Creek. Within the above-mentioned watersheds, 49 (forty nine) water crossings were identified along the proposed 407 TWY corridor. Figure 1.1 shows the location of all water crossings. Refer to Table 2.1 for details.

Notes:

1- All the data related to Flow/Thermal Regime has been taken from Fish and Fish Habitat - Impact Assessment Report (LGL April 2016)

2- All data related to Subwatershed ID and and TRCA tributary Names has been taken from the following reports:
Rouge River Watershed, hydrology update, Final Report, TRCA, June 2001
2012 Duffins Creek Hydrology Update, Finla Report, TRCA, February 2013

3 - Cells highlighted in blue represent creeks identified by LGL

2.2. Soils

Review of Ontario Geological Survey maps shows that the study area located within Rouge River mainly falls under till soil group with some sections along major creeks falling in clay, silt, sand, gravel, which may contain organic remains. Also, a section between McCowan Road and Markham Road is located in sand soil groups. Refer to Figure 2.1 in Appendix A.

Study of Ontario Geological Survey maps shows that the study area within the Duffins Creek watershed is located in till soil group except a small part between York Durham Line and North Road situated in clay, silt, sand, gravel, which may contain organic remains. The general slope of the crossing subwatersheds along 407 TWY is northern-southern with an average slope of 4.8%. The review of Duffins Creek hydrology report and Google Maps show the dominate land use in the study area is Agricultural lands. Refer to Figure 2.2 in Appendix A.

2.3. Rainfall Data

The 12-hour AES design storm was selected by TRCA for application in the Rouge River, Petticoat Creek and Duffins Creek watersheds hydrologic modelling. As noted in the documentations received from TRCA for the hydrologic modelling of all watersheds, the AES distribution was selected over both the U.S. Soil Conservation Service (SCS) and Chicago distributions, as it is more suitable for a Southern Ontario study area.

Additionally, the design of storage facilities designed for the purpose of this study considers both storm events, 4hr Chicago and 12hr AES and comparison of modelling results is summarized in several tables in the report. The 12hr AES remains the design storm per TRCA's hydrologic modelling of the watershed and the 4hr Chicago is used to comply with the MTO criteria. The rainfall files were developed in VO2 using the latest IDF curves provided by MTO for 407 ETR and Brock Rd (refer to IDF Curve Look-up, MTO included in Appendix B).

VO2 modelling simulation order is as follows:

- Simulation 1: 2-yr 12hr AES (or Chicago 4-hr)
- Simulation 2: 5-yr 12hr AES (or Chicago 4-hr)
- Simulation 3: 10-yr 12hr AES (or Chicago 4-hr)
- Simulation 4: 25-yr 12hr AES (or Chicago 4-hr)
- Simulation 5: 50-yr 12hr AES (or Chicago 4-hr)
- Simulation 6: 100-yr 12hr AES (or Chicago 4-hr)

2.4. Existing Drainage Infrastructure

Parsons undertook a review of background information received from the 407 ETR and City of Markham. Drawings used as reference in this project are included in Appendix A. Table 2.2 and 2.3 in Appendix A summarize the major creek crossings along 407 ETR within the project limits of the proposed 407 TWY.

There is also number of existing ponds along the existing 407 ETR corridor, on the north and south side of the 407 ETR. A review of available SWM reports was undertaken to determine flows from these ponds that would eventually be conveyed through the 407 TWY ROW. A summary of data reviewed is in included in Table 2.4 in Appendix A. No SWM Pond reports were available for the existing 407 ETR ponds.

3. HYDROLOGIC ANALYSIS – EXISTING CONDITION

Watershed maps for Rouge River, Petticoat Creek and Duffins Creek Watersheds and hydrologic models, as well as rainfall files for each watershed were provided by TRCA for the purpose of this study. Figures 3.1 and 3.2, included in Appendix B show the watersheds digitized in CAD using original maps from TRCA.

The proposed transitway sub-areas were delineated from the larger watershed as shown Figure 3.3 and sketch SK-1 in Appendix B. The transitway sub-areas were delineated assuming a constant width of 19m, using the widest typical road cross-section available for the proposed 407 TWY. The input modelling parameters for each transitway sub-area were set to match the original VO2 input parameters per TRCA. Tables 3.1 to 3.3 in Appendix B show the parameters used in the TRCA model for each watershed. In cases where the larger subwatershed is modelled as a Standhyd, the same command was used for the analysis of the TWY sub-areas; however, the imperviousness was adjusted to 20%. Similarly, where the larger subwatershed is modelled as a NASHYD/WILLHYD, the same command and input parameters were used to define the transitway sub-area, to be conservative.

3.1. Rouge River Watershed

The hydrologic model and watershed map for the Rouge River watershed were provided by TRCA. The relevant subwatersheds for the present study are highlighted in Figure 3.1 in Appendix B.

Hydrologic modeling for the Rouge River was based on three Visual OTTHYMO (VO2) models received from TRCA. Due to the size and complexity of the Rouge River watershed, TRCA has divided the complete regional model into subwatershed or reach models. The proposed transitway crosses the middle reach of Rouge River, as well as Little Rouge Creek; thus, the “Middle Rouge” and “Little Rouge” VO2 models were reviewed under existing conditions. The proposed transitway also crosses the lower reach of the Rouge River, but the TRCA did

not provide a separate model for this segment of the river. To ensure that all components of the river were accounted for in the hydrologic analysis, the Regional VO2 model, which includes the lower reach and all tributaries, was used.

For the existing conditions analysis, each catchment area crossed by the proposed transitway was subdivided to represent areas upstream, downstream, and part of the future transitway right-of-way. The sum of these areas is equal to the total area for each affected catchment area (refer to Figure 3.3 and Table 3.4 in Appendix B).

Updated schematics of Little Rouge, Middle Rouge, and Regional models (existing condition) are shown in Visual OTTHYMO Modelling Schematics 1 and 2 included in Appendix B.

Table 3.5 summarizes the existing condition peak flows generated by each transitway sub-area within Rouge sub-watershed. Visual OTTHYMO Modelling Schematic 3.1 used for the existing condition hydrologic analysis of the 407 TWY sub-areas, as well as model output files are included in Appendix B.

3.2. Petticoat Creek Watershed

The hydrologic model and watershed map for the Petticoat Creek watershed were provided by TRCA. The relevant subwatersheds for the present study as highlighted in Figure 3.2 in Appendix B. Table 3.6 in Appendix B shows the delineation of relevant sub-catchments used for the hydrologic analysis of the 407 TWY sub-areas.

Similar to the analysis undertaken for Rouge sub-watersheds, transitway sub-areas were delineated within Petticoat Watershed. Table 3.7 summarizes the existing condition peak flows generated by each transitway sub-area within Petticoat sub-watershed. Visual OTTHYMO Modelling Schematic 3.1 used for the existing condition hydrologic analysis of the 407 TWY sub-areas, as well as model output files are included in Appendix B.

3.3. Duffins Creek Watershed

Similarly, TRCA provided us with all the data pertinent to the watershed characteristics (model was provided in VH3). The methodology for subcatchment separation was performed as described in the previous section. Refer to Figure 3.3 and Table 3.8 in Appendix B.

Duffins watershed uses unit rates formulas for the determination of allowable peak flows within each sub-watershed. Refer to Table 3.9 for allowable rates.

4. HYDROLOGIC ANALYSIS – POST-DEVELOPMENT CONDITION

The proposed 407 TWY crosses several subwatersheds within Rouge, Petticoat and Duffins Creek. As a result of the introduction of the 407 TWY existing drainage patterns are interrupted and conveyance of flow through the proposed 407 TWY ROW has to be provided. As previously discussed and as described in Figure 3.3 in Appendix B the larger subwatersheds were subdivided between upstream areas, TWY sub-areas (areas allocated for the proposed TWY) as well as downstream areas. Figure 4.1 and 4.2 in Appendix D show the TWY sub-areas delineated within each watershed.

4.1. Analysis of Upstream Sub-Catchments

Twenty three (23) water crossings within the study limits are impacted by the proposed 407 TWY. TRCA provided the hydraulic model for five (5) of these water crossings: WC 13, 15b, 15c, 18 and 28 & 29, therefore no hydrologic analysis is required for these. For the remaining eighteen (18), a hydrologic analysis of the drainage areas upstream of the proposed 407 TWY was undertaken. Drainage area maps were delineated for all eighteen (18) water crossings analyzed and maps are included in Figures 4.3 to 4.9 in Appendix C.

The original model parameters from TRCA were maintained in the hydrologic analysis and areas only were adjusted to reflect the drainage boundary at the upstream side of the proposed 407 TWY. Chicago 4-hr distribution using MTO's IDF curves was used in this analysis and peak flows for all upstream areas are summarized in Table 4.1. These flows will further be used in the HEC-RAS analysis of the proposed structures (refer to Section 6 of this report).

Visual OTTHYMO Model Schematic 4.1 and 4.2 in Appendix C show the upstream catchment areas analyzed in VO2. Model output files are included in Appendix C.

4.2. Analysis of Transitway Sub-Areas

The drainage areas along the proposed TWY were delineated based on the high points and low points along the road profile. Drainage Area Maps of TWY areas within Rouge, Petticoat and Duffins watersheds are shown in Figure 4.1 and 4.2 in Appendix D.

The methodology for determining the outlet controlled rates for the TWY sub-areas (refer to SK-2 in Appendix D) was conducted as follows:

- In post-development condition the assumption is that sub-areas are draining from high points to low points, in cases where a sub-area crosses a potential water feature, the strategy was to discharge at such point. If this was the case the area was further subdivided.
- The resulting sub-areas could potentially cross-over two or more larger subwatersheds.
- For Rouge River the release rates are based on the pre-development peak flow for the transitway sub-area within the larger subwatershed where the discharge point is located.
- The release rates are set at each sub-area based on the outlet/low point location using the unit rates for Duffins Creek.

4.2.1. Post-Development Condition Uncontrolled (without SWM)

The post-development condition uncontrolled scenario was run to demonstrate the need of stormwater management facilities within the study limits. Tables 4.2, 4.3 and 4.4 show the difference in peak flows between the existing and post-development condition uncontrolled. Modelling results indicate that an overall significant increase of approximately 6% to 466% is noted within Rouge and Petticoat watersheds. Higher increases of approximately 2000% are noted in Duffins watershed due to more stringent criteria for quality control within this watershed (unit rates). Modelling results indicate that SWM facilities are required to meet the existing/allowable rates within each subwatershed, with the exception of Rouge subwatershed 318 where a decrease in peak flows in noted due to areas being directed to subwatershed 314. Peak flows from areas 318-1 and 318-2 are proposed to be discharged to existing pond ID R-4.

Visual OTTHYMO Model Schematic 4.3 and 4.4 in Appendix D show the uncontrolled scenario for the 407 TWY sub-areas analyzed in VO2. Model output files are included in Appendix D.

4.2.2. Post-Development Condition with SWM

A hydrologic analysis was undertaken for the project to quantify the amount of storage required to achieve the allowable discharges within each subwatershed. This section discusses the post-development condition controlled scenario undertaken for the transitway sub-areas. In addition, five stations are proposed along the study limits and their stormwater management strategy is presented in Section 5 of this report.

The transitway sub-areas delineated along the proposed 407 TWY alignment are shown in Figures 4.1 and 4.2 in Appendix D. The drainage area at each transitway outlet is less than 5 ha, therefore wet ponds are not feasible to be constructed to provide quality and quantity control for the paved area of the runningway. A treatment train approach is implemented consisting of grassed embankments to promote sheet flow, grassed swales on both sides of the transitway and enhanced grassed swales/dry ponds located before each outlet from the transitway. The drainage strategy of the 407 TWY sub-areas within each subwatershed including details related to discharge points of each swale as well as quantity control criteria are presented in Table 4.5 in Appendix D.

4.2.2.1. Proposed Enhanced Swales

Grassed swales are proposed along the entire length of the transitway. Since the swales will follow the slope of the road, which in some instances is steep, segments of enhanced swales are proposed before any stormwater discharge to a watercourse or any other type of outlet. The enhanced swales would cover approximately 50 m length and are designed to have a trapezoidal cross-section, flat bottom (1 m wide), 3:1 side slopes and a depth of 1.5 m. A longitudinal slope of maximum 0.2% is proposed for all swales to provide settlement of sediment and to reduce flow velocities from upstream segment. In order to increase the time of flow in the swales and to promote infiltration at the same time, two cells were designed with a 0.5 m layer of clear stone covered by 0.3 m of topsoil below the invert of the swale. The enhanced swales were designed in a form of dry ponds with a formal outlet control structure to provide quality and quantity control for transitway sub-areas. The outlet is comprised of a 100 mm perforated pipe proposed to be installed at the bottom of each swale that is further connected to a hickenbottom structure equipped with a 75 mm orifice plate. Swale details (plan view, cross-sections and longitudinal profile) are shown in SK-3 in Appendix D. The maximum volume that can be stored in an enhanced swale is calculated to be 412.5 m^3. The controlled discharge rate from the swale was calculated to be 0.015 m^3/s using the orifice equation (75 mm diameter) – refer to Table 4.6 in Appendix D. For modelling purposes, it is considered that the swale volume used is maximized, and the maximum discharge would be 0.015 m^3/s. Modelling results indicate that in some instances the volumes required could be less than the maximum volume provided by the swale; a smaller head would result in less discharge at the outlet as shown in the results. Our approach is conservative since we are using the minimum allowable orifice and providing more storage than required.

Tables 4.7, 4.8 and **4.9** in **Appendix D** show the quantity control strategy for each swale. **Figure 4.1** and **4.2** in **Appendix D** show the location of all swales identified along the transitway. In instances where the volume required exceeds 412.5 m^3, additional swales are proposed to provide the required volume (one example is ES-1 where storage required is 700 m^3; two swales ES-1a and ES-1b are designed to provide 825 m^3 maximum storage).

Flows generated by the 25 mm Chicago 4hr event vary between 0.001 m^3/s and 0.003 m^3/s for each swale as shown in **Table 4.5** in **Appendix D**. Considering the swales have a maximum 0.2% longitudinal slope velocities in the swale are approximately 0.13 m/s which is less than 0.5 m/s as required by TRCA (see Table "25mm 4hr Chicago event" in **Appendix D**).

4.2.2.2. Summary of Modelling Results

Based on the quantity controls identified in **Tables 4.7, 4.8** and **4.9** in **Appendix D**, modelling results for the transitway sub-areas within each subwatershed were summarized in **Tables 4.10, 4.11** and **4.12** to show the results of the hydrologic analysis for all conditions analyzed. The results indicate that no increases are expected within Rouge and Petticoat Watersheds. Increases are noted within Duffins watershed (Subwatershed 8, 31 and 39) due to the extremely low allowable release rates (based on units-rates formulas) and the minimum orifice size of 75 mm at the outlet of the proposed swales, although sufficient volume is provided in the swales. The increases vary between 0.001 m^3/s and 0.004 m^3/s at the outlet of the swales compared to the allowable rates. These increases can be considered small and do not pose significant erosion/scour impacts at the outlets. Velocities could be further mitigated with vegetated outlets or energy dissipaters. Parsons looked at the feasibility of enlarging the footprint of the enhanced swales to lower the hydraulic head of the 75 mm orifice and found that the area of ponding would be larger than the transitway segment itself. During detailed design, it is recommended that a more detailed analysis be carried out to determine an optimum swale cross-section/head-discharge-storage relationship to avoid these increases.

Pumping is required at three locations within (within Rouge sub-watershed 614 and 522 and Petticoat subwatershed 1) where the TWY alignment goes underground. Refer to details in **Figure 5.1** and **5.3** in **Appendix E**. The peak flows at these locations are summarized in **Tables 4.10** and **4.11** in **Appendix D**.

The stormwater management strategy recommends that flows from several enhanced swales be directed to the existing 407 ETR ditches and ultimately to existing ponds. Ponds LR-1, LR-5, WD-2 and G1 were identified as possible outlets. It is recommended that the capacity of existing 407 ponds to be assessed during detailed design to confirm if sufficient capacity exists in the ponds for additional flows.

Visual OTTHYMO Model Schematic 4.5 and 4.6 in Appendix D show the post-development condition with SWM scenario for the 407 TWY sub-areas analyzed in VO2. Model output files are included in Appendix D.

5. STORMWATER MANAGEMENT

5.1. Stormwater Management Criteria

The TRCA's criteria for stormwater management quantity, quality and erosion control are as follows:

Table 5.0. Stormwater Management Criteria

Quantity Control	Rouge Watershed: match post-development peak flows to pre-development levels for all return periods analyzed (TRCA Stormwater Management Criteria, V 1.0, Aug 2012) Duffins Watershed: post-development peak flows were controlled to levels set by allowable unit flow rates based on the TRCA's Unit Flow Rate (2012 Duffins Creek Hydrology Update, Final Report, Feb 2013)
Quality Control	Enhanced protection (Level-1) criteria to determine the minimum permanent pool size for wet pond facilities Table 3.2 of the Stormwater Management Planning and Design Manual (MOECC, 2003)
Erosion Control	25mm attenuation for 48 hours (Rouge) (TRCA Stormwater Management Criteria, V 1.0, Aug 2012) 25mm attenuation for 120 hours (Duffins) (Duffins Watershed – criteria for developments within Seaton Lands) 5 mm retention for each station area, as per TRCA SWM Criteria (2012)
Thermal Considerations	3m permanent pool depth and others (e.g: cooling trenches) (Guidance for Development Activities in Redside Dace Protected Habitat , MNRF V 1.1 (2014)

5.2. Proposed Stormwater Management Strategy

The proposed strategy is included in Figure 4.1 and 4.2 in Appendix B. For the TWY areas the strategy was to implement enhanced swales and dry ponds because the subareas were less than the 5.0ha requirement of wet ponds.

5.2.1. Transitway Sub-Areas

Quantity control requirements were discussed in Section 4.2.2 of this report. In addition, 80% TSS removal is required for stormwater flows generated by the transitway subareas. As previously noted a treatment train approach is implemented consisting of grassed embankments to promote sheet flow, grassed swales and enhanced grass swales/dry ponds located before each outlet from the transitway.

Grassed swales are proposed along the entire length of the transitway. Since the swales will follow the slope of the road, which in some instances is steep, segments of enhanced swales are proposed before any stormwater discharge to a watercourse or any other type of outlet. The enhanced swales would cover approximately 50m length with a longitudinal slope of 0.2% to provide settlement of sediment and to lessen the flow velocities from upstream segment. In addition, in order to increase the time of flow in the swales and to promote infiltration at the same time, two cells were designed with a 0.5m layer of clear stone covered by 0.3m of topsoil.

To support our use of enhanced swales and to prove the efficiency of the enhanced swales for transitway sub-areas, Parsons undertook a literature review (see reference materials 11 to 14 at the end of this Report). The removal efficiency of grassed swales is noted in a number of reference materials. As noted in Reference 11 (*"Highway Runoff Water Quality Literature Review, MAT-92-13, MTO Research and Development Branch, April 1992"*) and Reference 12 (*"Highway 407 East Phase 2, Stormwater Management Plan Framework, Condition 7, EAB File EA-05-08, October 2013, revised March 2014, Final Draft*) the enhanced grassed swales can achieve between 76% and 90% reduction in total suspended solids generated by highway runoff.

Oil grit-separators (OGS) are well known for their application in urban areas where there is limited space for stormwater management facilities. They are most likely to be used in defined impervious areas where the storm runoff is concentrated and collected in a piped system. However, as also noted in reference 12 (*"Highway 407 East Phase 2, Stormwater Management Plan Framework, Condition 7, EAB File EA-05-08, October 2013, revised March 2014, Final Draft*) MTO has not used OGS along highways primarily due to the initial cost of the units, the relatively small drainage area that can be treated by each units and the on-going maintenance requirements. In addition, the units provide only 50% TSS removal as indicated by the New Jersey Department of Environmental Protection.

Due to the reasons listed above, Parsons recommends the use of treatment train approach consisting of grassed embankments, grassed swales and enhanced grassed swales to provide quality and quantity control of transitway sub-areas.

5.2.2. Proposed 407 TWY Stations

Five stations will be located along the proposed length of the transitway, at the following locations: Markham Road, Ninth Line, Donald Cousens Parkway, Whites Road, and Brock Road. Parsons undertook a preliminary hydrologic analysis to determine volume requirements for stormwater management facilities. The drainage area maps of all stations are included Figures 5.1 to 5.5 in Appendix E.

The VO2 modelling has been undertaken assuming one area that combines all areas shown in each map noted above. The methodology is presented below as follows:

Existing condition

- identified TRCA subwatershed were station will be located
- used the TRCA VO2 input parameters of each specific subwatershed, per Table 3.1 in Appendix B
- if Standhyd is used in the TRCA-existing condition, we used 20% imperviousness since land is currently not developed

Post-Development Condition

- all stations are modelled as Standhyd assuming TIMP= 90% and XIMP=50%
- drainage area will be the total contributing drainage area as shown in Figures 5.1 to 5.5 in App B.
- all the other parameters are per TRCA's VO2 model

Results of existing and post-development condition hydrologic analysis for each station are included in Table 5.1 to Table 5.7 in Appendix E. Modelling Schematics as well as VO2 model output files of each stations are also included in Appendix E.

The proposed stormwater management facilities are shown in Figures 5.1 to 5.5 and the design details are shown in Tables 5.1(a to f) to 5.7(a to f) in Appendix E. The SWM strategy includes wet ponds with controlled structures consisting of multiple orifices and/or weirs. A hydrologic analysis has been undertaken for each site and modelling results show no increase in post-development peak flows compared to existing levels (Rouge) or allowable.

5.2.2.1. Markham Road Station

Markham Road station has a total catchment area of 6.87 ha. Table 5.1g provides a tabular summary of the drainage areas at the station.

Table 5.1g. Summary of Markham Road Station Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)	Notes
A-1	0.76	0.68	Development of this area is outside the scope of the Transitway development; however, a 90% imperviousness was assumed for the post-development condition
A-2	3.62	3.26	
A-3	0.42	0.38	
A-4	0.49	0.44	
A-5	0.28	0.25	
A-6	0.86	0.77	
A-7	0.78	-	
Station Total	7.21	5.78	For an area of 7.21 ha, the 5 mm retention volume (TRCA SWM Criteria, 2012) is 360.5 m^3.

*Assumed 90% imperviousness for developed areas, except A-7 which will remain pervious after development.

Development of the station land significantly increases peak flow rates during storm events, as indicated in Table 5.1h.

Table 5.1h. Comparison of Pre-Development and Post- Development (Uncontrolled) Release Rates at Markham Road Station

12hr AES Return Period	Pre-Development Peak Flow (m^3/s)	Post-Development Peak Flow (Uncontrolled) (m^3/s)	Increase from Allowable (Pre-Development) Peak Flow to Post-Development (Uncontrolled) Peak Flow (%)
2-yr	0.145	0.347	139.31%
5-yr	0.228	0.467	104.82%
10-yr	0.294	0.545	85.37%
25-yr	0.374	0.644	72.19%
50-yr	0.437	0.717	64.07%
100-yr	0.513	0.789	53.80%

Two enhanced swales and a wet pond are proposed to provide quality and quantity control for Markham Road Station. The enhanced swales, each with a total available volume of 412.5 m^3, will control flows from drainage areas A-4 (0.49 ha) and A-7 (0.78 ha), as geographic constraints do not allow for these areas to connect to SWMF-1, which will serve the remaining drainage area of 5.94 ha. SWMF-1 is an extended detention wet pond with a total available volume of 4801 m^3. The permanent pool has an average depth of 1.6 m and a volume of 1336 m^3 for quality control; this volume is larger than that required to meet the 5 mm retention criteria for erosion control. Table 5.1d in Appendix E shows the design parameters of the proposed pond. Details of the outlet structure, as well as the stage-storage, stage-discharge relationships of the pond are included in Table 5.1e in Appendix E. Table 5.1f in Appendix E shows that the orifice size required to attenuate the 25mm in 24hr is 90 mm. Therefore, to provide the erosion control the pond will be equipped with a 90 mm orifice (invert elevation of 179.06 m). To achieve the quantity control requirements one additional orifice is proposed:

- Orifice #2: dia = 440mm, invert elevation = 179.63 m

Storage and discharge characteristics of this facility are summarized in Table 5.1i.

Table 5.1i. Storage and Discharge Characteristics of SWMF-1

12hr AES Return Period	Pre-Development Peak Flows (allowable rates) (m^3/s)	SWMF-1 CHARACTERISTICS		Overall Post Development (Controlled) Peak Flows (m^3/s)	Decrease Post-Development Controlled to Allowable (%)
		Storage Available (m^3)	Release Rate (m^3/s)		
2-yr	0.145	1300	0.113	0.118	-22.88%
5-yr	0.228	1560	0.187	0.184	-23.91%
10-yr	0.294	1748	0.226	0.235	-25.11%
25-yr	0.374	1967	0.304	0.313	-19.49%
50-yr	0.437	2113	0.366	0.378	-15.61%
100-yr	0.513	2257	0.425	0.437	-17.39%

A 975 mm STM outlet pipe is proposed for SWMF-1. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 950 mm weir at the top of the outlet structure (invert elevation of 179.87 m) serves as an emergency overflow spill for the pond. An emergency overflow spillway is also provided on the east side of the pond, so that the pond will not overtop if the outlet pipe is blocked.

The pond is equipped with bottom draw pipe connected to the outlet structure.

5.2.2.2. Ninth Line Station

Table 5.2g provides a tabular summary of the drainage areas at Ninth Line Station.

Table 5.2g. Summary of Ninth Line Station Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)	Notes
A-1	1.69	1.52	Development of this area is outside the scope of the Transitway development. On-site quality and quantity control are to be provided separately when this area is developed.
A-2	0.47	0.42	
A-3	0.68	-	This area will not be developed as part of the Transitway project.
A-4	0.75	0.68	
A-5	5.14	4.63	
A-6	0.40	0.36	
Station Total	9.13	7.61	For an area of 9.13 ha, the 5 mm retention volume (TRCA SWM Criteria, 2012) is 456.5 m^3.

*Assumed 90% imperviousness for developed areas, except for A-3 which will not be developed as part of this project.

Development of the station land significantly increases peak flow rates during storm events, as indicated in Table 5.2h.

Table 5.2h. Comparison of Pre-Development and Post- Development (Uncontrolled) Release Rates at Ninth Line Station

12hr AES Return Period	Pre-Development Peak Flow (m^3/s)	Post-Development Peak Flow (Uncontrolled) (m^3/s)	Increase from Allowable to Post-Development (Uncontrolled) Peak Flow (%)
2-yr	0.146	0.370	153.42%
5-yr	0.230	0.501	117.83%
10-yr	0.297	0.589	98.32%
25-yr	0.378	0.699	84.92%
50-yr	0.442	0.781	76.70%
100-yr	0.519	0.864	66.47%

One enhanced swale and a wet pond are proposed to provide quality and quantity control for Ninth Line Station. The enhanced swale, which has a total available volume of 412.5 m^3, will control flows from drainage area A-2 (0.47 ha) because geographic constraints do not allow for these areas to connect to SWMF-2. SWMF-2 will provide quantity and quality control for drainage areas A-4 through A-6, as well as drainage area 604-3 from the transitway (1.18 ha); a total catchment area of 7.47 ha. SWMF-2 is an extended detention wet pond with a total available volume of 6242 m^3. The permanent pool has an average depth of 2.1 m and a volume of 1681 m^3 for quality control; this volume is also larger than that required to meet the 5 mm retention criteria for erosion control. Table 5.2d in Appendix E shows the design parameters of the proposed pond. Details of the outlet structure, as well as the stage-storage, stage-discharge relationships of the pond are included in Table 5.2e in Appendix E. Table 5.2f in Appendix E shows that the orifice size required to attenuate the 25mm in 24hr is 102 mm. Therefore, to provide the erosion control the pond will be equipped with a 102 mm orifice (invert elevation of 171.62 m). To achieve the quantity control requirements one weir is proposed:

- Weir #1: width = 900 mm, invert elevation = 172.16 m

Storage and discharge characteristics of this facility are summarized in Table 5.2i.

Table 5.2i. Storage and Discharge Characteristics of SWMF-2

12hr AES Return Period	Pre-Development (Allowable) Peak Flow	SWMF-2 CHARACTERISTICS		Overall Post Development (Controlled) Peak Flows	Decrease Post-Development Controlled to Allowable Peak Flow
		Storage Provided	Release Rate		
	(m^3/s)	(m^3)	(m^3/s)	(m^3/s)	(%)
2-yr	0.146	1183	0.071	0.079	-84.81%
5-yr	0.230	2115	0.149	0.162	-41.98%
10-yr	0.297	2330	0.218	0.242	-22.73%
25-yr	0.378	2604	0.313	0.348	-8.62%
50-yr	0.442	2801	0.373	0.417	-6.00%
100-yr	0.519	2992	0.436	0.487	-6.57%

A 975 mm STM outlet pipe is proposed for SWMF-2. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 1900 mm weir at the top of the outlet structure (invert elevation of 172.61 m) serves as an emergency overflow spill for the pond. The pond is equipped with bottom draw pipe connected to the outlet structure.

5.2.2.3. Donald Cousens Parkway Station

Table 5.3g provides a tabular summary of the drainage areas at Donald Cousens Parkway Station.

Table 5.3g. Summary of Donald Cousens Parkway Station Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)	Notes
A-1	0.27	0.24	
A-2	1.84	1.66	
A-3	0.55	0.50	
A-4	0.58	0.52	
A-5	0.19	0.17	
A-6	0.78	0.70	
Station Total	4.21	3.79	For an area of 4.21 ha, the 5 mm retention volume (TRCA SWM Criteria, 2012) is 210.5 m^3.

*Assumed 90% imperviousness for developed areas.

Development of the station land significantly increases peak flow rates during storm events, as indicated in Table 5.3h.

Table 5.3h. Comparison of Pre-Development and Post- Development (Uncontrolled) Release Rates at Donald Cousens Parkway Station

12hr AES Return Period	Pre-Development Peak Flow (m^3/s)	Post-Development Peak Flow (Uncontrolled) (m^3/s)	Increase from Allowable to Post-Development (Uncontrolled) Peak Flow (%)
2-yr	0.047	0.278	491.49%
5-yr	0.078	0.374	379.49%
10-yr	0.100	0.437	337.00%
25-yr	0.131	0.516	293.89%
50-yr	0.155	0.574	270.32%
100-yr	0.179	0.632	253.07%

Two enhanced swales and a wet pond are proposed to provide quality and quantity control for Donald Cousens Parkway Station. The enhanced swales, each with a total available volume of 412.5 m^3, will control flows from drainage areas A-5 (0.19 ha) and A-6 (0.78 ha), as geographic constraints do not allow for these areas to connect to SWMF-3. SWMF-3 will provide quantity and quality control for the rest of the station's drainage areas, as well as drainage areas 522-2 (0.74 ha) and 522-3 (0.82 ha) from the transitway, for a total catchment area of 4.80 ha. SWMF-3 is an extended detention wet pond with a total available volume of 4545 m^3. The permanent pool has an average depth of 1.1 m and a volume of 1080 m^3 for quality control; this volume is also larger than that required to meet the 5 mm retention criteria for erosion control. Table 5.3d in Appendix E shows the design parameters of the proposed pond. Details of the outlet structure, as well as the stage-storage, stage-discharge relationships of the pond are included in Table 5.3e in Appendix E. Table 5.3f in Appendix E shows that the maximum orifice size required to attenuate the 25mm in 24hr is 84 mm. To provide the erosion control and meet the quantity control requirement for the 2-year return period, the pond will be equipped with a 75 mm orifice (invert elevation of 186.58 m). To achieve the remaining quantity control requirements an additional orifice and a weir are proposed:

- Orifice #2: dia = 180 mm, invert elevation = 187.29 m
- Weir #1: width = 800 mm, invert elevation = 187.52 m

Storage and discharge characteristics of this facility are summarized in Table 5.3i.

Table 5.3i. Storage and Discharge Characteristics of SWMF-3

12hr AES Return Period	Pre-Development (Allowable) Peak Flow (m^3/s)	SWMF-3 CHARACTERISTICS		Overall Post-Development (Controlled) Peak Flow (m^3/s)	Decrease Post-Development Controlled to Allowable (%)
		Storage Provided (m^3)	Release Rate (m^3/s)		
2-yr	0.047	1483	0.010	0.018	-161.07%
5-yr	0.078	1809	0.037	0.048	-6.85%
10-yr	0.100	2080	0.046	0.059	-14.94%
25-yr	0.131	2287	0.080	0.095	-5.65%
50-yr	0.155	2438	0.113	0.130	-9.15%
100-yr	0.179	2565	0.147	0.166	-0.56%

A 975 mm STM outlet pipe is proposed for SWMF-3. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 2000 mm overflow weir at the top of the outlet structure (invert elevation of 187.69 m) serves as an emergency overflow spill for the pond. The pond is equipped with bottom draw pipe connected to the outlet structure.

5.2.2.4. Whites Road Station

Two stormwater management facilities are proposed for Whites Road Station. SWMF-4 will provide quality and quantity control for the northern half of the station, including the bus loop, access road, and the station itself, as well as areas 34-1 and 34-2 from the transitway; a total catchment area of 3.97 ha. SWMF-5 will provide quality and quantity control for the southern half of the Station, including the south employment collector and the parking lot south of the access road; a total catchment area of 3.46 ha. The drainage areas for each facility are summarized in Table 5.4g and Table 5.5g respectively.

Table 5.4g. Summary of SWMF-4 Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)	Notes
A-1	0.28	0.25	
A-2	0.53	0.48	
A-4	1.87	1.68	
34-1	0.40	0.36	From Transitway
34-2	0.89	0.80	From Transitway
SWMF-4 Drainage Area Total	3.97	3.57	

Table 5.5g. Summary of SWMF-5 Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)
A-3	0.66	0.59
A-5	2.46	2.21
A-6	0.34	0.31
SWMF-5 Drainage Area Total	3.46	3.11

Development of the station land significantly increases peak flow rates during storm events, as indicated in Table 5.4h and Table 5.5h.

Table 5.4h. Comparison of Allowable and Post- Development (Uncontrolled) Release Rates at Whites Road Station (SWMF-4 Drainage Areas)

12hr AES Return Period	Allowable Release Rate (Unit Rates - Subwatershed 31) (m^3/s)	Post-Development Condition Uncontrolled Peak Flow (m^3/s)	Increase from Allowable to Post-Development (Uncontrolled) Peak Flow (%)
2-yr	0.009	0.449	4888.89%
5-yr	0.015	0.647	4188.74%
10-yr	0.019	0.767	3924.98%
25-yr	0.025	0.916	3627.47%
50-yr	0.029	1.026	3454.86%
100-yr	0.033	1.137	3301.40%

Table 5.5h. Comparison of Allowable and Post- Development (Uncontrolled) Release Rates at Whites Road Station (SWMF-5 Drainage Areas)

12hr AES Return Period	Allowable Release Rates (Unit Rates - SubWatershed 31) (m^3/s)	Post-Development Condition (Uncontrolled) Peak Flow (m^3/s)	Increase from Allowable to Post-Development (Uncontrolled) Peak Flow (%)
2-yr	0.008	0.393	4672.43%
5-yr	0.013	0.566	4204.84%
10-yr	0.017	0.671	3940.22%
25-yr	0.021	0.801	3639.95%
50-yr	0.025	0.897	3466.00%
100-yr	0.029	0.994	3311.91%

SWMF-4 is an extended detention wet pond with a total available volume of 7835 m^3. The permanent pool has an average depth of 3.0 m and a volume of 3590 m^3 for quality control; this volume is also larger than that required to meet the 5 mm retention criteria for erosion control. Table 5.4d in Appendix E shows the design parameters of the proposed pond. Details of the outlet structure, as well as the stage-storage, stage-discharge relationships of the pond are included in Table 5.4e in Appendix E. Table 5.4f in Appendix E shows that the maximum orifice size required to attenuate the 25mm in 120hr is 52 mm; this is smaller than the minimum orifice size requirement of 75mm. To provide erosion control, the pond will be equipped with a 75mm orifice (invert elevation of 213.50 m). The 75 mm diameter orifice provides 57.6 hour detention of the 25 mm event; a shortfall of 62.4 hours.

To achieve the quantity control requirements, one weir is proposed:

- Weir #1: width = 100 mm, invert elevation = 214.26 m

Due to the use of the 75 mm orifice, the 2-year required storage target could not be met by a shortfall of 49 m^3. Storage and discharge characteristics of SWMF-4 are summarized in Table 5.4i.

Table 5.4i. Storage and Discharge Characteristics of SWMF-4

12hr AES Return Period	Allowable Release Rates (Unit Rates – Subwatershed 31)	SWMF-4 CHARACTERISTICS			Decrease Post-Development Controlled to Allowable Peak Flow
		Storage Provided	Storage Required	Release Rate	
	(m^3/s)	(m^3)	(m^3)	(m^3/s)	(%)
2-yr	0.009	1150	1199	0.009	0.00%
5-yr	0.015	1576	1552	0.010	-50.86%
10-yr	0.019	1871	1767	0.011	-73.24%
25-yr	0.025	2174	2052	0.017	-44.55%
50-yr	0.029	2372	2259	0.024	-20.26%
100-yr	0.033	2553	2461	0.031	-7.83%

A 975 mm STM outlet pipe is proposed for SWMF-4. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 700 mm overflow weir at the top of the outlet structure (invert elevation of 214.51 m) serves as an emergency overflow spill for the pond. The pond is equipped with bottom draw pipe connected to the outlet structure.

Whites Road Station – Design Alternatives

Three options were considered for SWMF-5.

- The first option was a 32.5 m by 35 m underground storage tank with a permanent pool and forebay. This option was not pursued due to its limitations with regard to quality control and maintenance requirements.
- The second option was a wet pond to be located to the south of the future collector road. Although this location (i.e.: outside of the proposed station footprint) provided a better opportunity to adjust the size of the facility to meet storage and flow requirements, it was not pursued because it would increase the overall footprint of the station and infringe on environmentally constrained land. Sketches of these options are provided in Appendix E.
- The third option was a wet pond located within the station's original proposed footprint; this option was pursued as SWMF-5.

SWMF-5 is an extended detention wet pond with a total available volume of 4575 m^3. The permanent pool has an average depth of 2.5 m and a volume of 1341 m^3 for quality control; this volume is also larger than that required to meet the 5 mm retention criteria for erosion control. Table 5.5-d in Appendix E shows the design parameters of the proposed pond. Details of the outlet structure, as well as the stage-storage, stage-discharge relationships of the pond are included in Table 5.5e in Appendix E. Table 5.5f in Appendix E shows that the maximum orifice size required to attenuate the 25mm in 120hr is 45 mm; this is smaller than the minimum orifice size requirement of 75mm. To provide erosion control, the pond will be equipped with a 75mm orifice (invert elevation of 211.00 m). The 75 mm diameter orifice provides 44.3 hour detention of the 25 mm event; a shortfall of 75.7 hours. To achieve the quantity control requirements, a weir is proposed:

- Weir #1: width = 200 mm, invert elevation = 212.00 m

Due to the use of the 75 mm orifice, the 2-year required storage target could not be met by a shortfall of 79 m^3, the 2-year required flow target was exceeded by 1 L/s, and the 5-year required storage target could not be met by a shortfall of 16m^3. Storage and discharge characteristics of SWMF-5 are summarized in Table 5.5i.

Table 5.5i. Storage and Discharge Characteristics of SWMF-5

12hr AES Return Period	Allowable Release Rates (Unit Rates – Subwatershed 31)	SWMF-5 CHARACTERISTICS			Decrease Post-Development Controlled to Allowable Peak Flow
		Storage Provided	Storage Required	Release Rate	
	(m^3/s)	(m^3)	(m^3)	(m^3/s)	(%)
2-yr	0.008	966	1045	0.009	8.50%
5-yr	0.013	1337	1353	0.010	-31.48%
10-yr	0.017	1592	1540	0.011	-50.98%
25-yr	0.021	1900	1789	0.013	-64.75%
50-yr	0.025	2083	1969	0.019	-32.39%
100-yr	0.029	2226	2145	0.027	-7.90%

A 975 mm STM outlet pipe is proposed for SWMF-5. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 1200 mm overflow weir at the top of the outlet structure (invert elevation of 212.13 m) serves as an emergency overflow spill for the pond. The pond is equipped with bottom draw pipe connected to the outlet structure.

Neither SWMF-4 nor SWMF-5 meet the 2-year storage requirement or the 120 hour detention criteria due to the minimum 75 mm orifice criteria. During detailed design, the possibility of connecting the two facilities should be assessed as a potential way to meet these criteria within the existing pond footprints.

5.2.2.5. Brock Road Station

Two stormwater management facilities are proposed for this station. SWMF-6 will be constructed to the north of the transitway to provide quality and quantity control for transitway area 37-1 (1.36 ha) and the undeveloped area to the west of the site, in order to maintain the existing drainage pattern as much as possible. The total contributing catchment area for this facility is 4.37 ha; drainage areas are summarized in Table 5.6g.

Table 5.6g. Summary of SWMF-6 Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)	Notes
A-27	0.80	0.72	
A-31	1.83	1.65	
A-32	0.38	0.34	
37-1	1.36	1.22	From transitway
Facility Total	4.37	3.93	

Development of the station land significantly increases peak flow rates during storm events in the areas draining to SWMF-6, as indicated in Table 5.6h.

Table 5.6h. Comparison of Allowable and Post- Development (Uncontrolled) Release Rates for SWMF-6 Drainage Areas

12hr AES Return Period	Allowable Release Rates (Unit Rates - Subwatershed 44) (m^3/s)	Post-Development Condition (Uncontrolled) Peak Flow (m^3/s)	Increase from Allowable to Post-Development (Uncontrolled) Peak Flow (%)
2-yr	0.013	0.203	1461.54%
5-yr	0.021	0.276	1214.29%
10-yr	0.027	0.324	1115.88%
25-yr	0.035	0.384	1008.64%
50-yr	0.041	0.428	946.08%
100-yr	0.048	0.473	885.42%

SWMF-6 is an extended detention wet pond with a total available volume of 4069 m^3. The permanent pool has an average depth of 3 m and a volume of 2976 m^3 for quality control; this volume is also larger than that required to meet the 5 mm retention criteria for erosion control. Table 5.6d in Appendix E shows the design parameters of the proposed pond. Details of the outlet structure, as well as the stage-storage, stage-discharge relationships of the pond are included in Table 5.6e in Appendix E. Table 5.6f in Appendix E shows that the maximum orifice size required to attenuate the 25mm in 120hr is 52 mm; this is smaller than the minimum orifice size requirement of 75mm. To provide erosion control, the pond will be equipped with a 75mm orifice (invert elevation of 182.45 m). The 75 mm diameter orifice provides 57.6 hour detention of the 25 mm event; a shortfall of 62.4 hours. To achieve the quantity control requirements, an additional orifice and a weir are proposed:

- Orifice #2: dia. = 95 mm, invert elevation = 183.02 m
- Weir #1: width = 60 mm, invert elevation = 183.28 m

Storage and discharge characteristics of SWMF-6 are summarized in Table 5.6i.

Table 5.6i. Storage and Discharge Characteristics of SWMF-6

12hr AES Return Period	Allowable Release Rates Unit Rates - Subwatershed 44	SWMF-6 CHARACTERISTICS			Decrease Post-Development Controlled to Allowable Peak Flow
		Storage Provided	Storage Required	Release Rate	
	(m^3/s)	(m^3)	(m^3)	(m^3/s)	(%)
2-yr	0.013	1297	1238	0.009	-44.44%
5-yr	0.021	1702	1598	0.018	-16.67%
10-yr	0.027	1985	1822	0.021	-26.89%
25-yr	0.035	2324	2107	0.029	-19.44%
50-yr	0.041	2562	2318	0.036	-13.65%
100-yr	0.048	2800	2524	0.042	-14.29%

A 975 mm STM outlet pipe is proposed for SWMF-6. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 2060 mm overflow weir at the top of the outlet structure (invert elevation of 183.58 m) serves as an emergency overflow spill for the pond. The pond is equipped with bottom draw pipe connected to the outlet structure.

The existing extended detention wet pond on the east side of the property (SWMF-7) will be regraded to allow for increased flows from the area to the west of the existing parking lot, and the outlet structure will be replaced to meet the allowable discharge rates for the increased catchment area. The drainage areas for this facility are summarized in Table 5.7g.

Table 5.7g. Summary of SWMF-7 Drainage Areas

Drainage Area ID	Area (Ha)	Post-Development Impervious Area* (Ha)
A-22	1.06	0.95
A-23	1.61	1.45
A-25	2.22	2.00
A-26	0.43	0.39
A-28	2.83	2.55
A-29	0.70	0.63
A-30	0.21	0.19
Facility Total	9.06	8.15

Development of the station land significantly increases peak flow rates during storm events in the areas draining to SWMF-7, as indicated in Table 5.7h.

Table 5.7h. Comparison of Allowable and Post- Development (Uncontrolled) Release Rates for SWMF-7 Drainage Areas

12hr AES Return Period	Allowable Release Rate (Unit Rate, Subwatershed 44) (m^3/s)	Post-Development Condition Uncontrolled Peak Flow (m^3/s)	Increase from Allowable to Post-Development Uncontrolled (%)
2-yr	0.027	0.416	1451.22%
5-yr	0.043	0.562	1197.72%
10-yr	0.055	0.661	1101.94%
25-yr	0.071	0.789	1003.75%
50-yr	0.084	0.881	943.35%
100-yr	0.098	0.972	889.71%

The regraded SWMF-7 will have a total available volume of 10771 m^3, and a permanent pool volume of 3090 m^3 for quality control; this volume is also larger than that required to meet the 5 mm retention criteria for erosion control. Table 5.7d in Appendix E shows the design parameters of the proposed pond. Details of the outlet structure, as well as the stage-storage, stage-discharge relationships of the pond are included in Table 5.7e in Appendix E. Table 5.7f in Appendix E shows that the maximum orifice size required to attenuate the 25mm in 120hr is 75 mm. To provide erosion control, the pond will be equipped with a 75mm orifice (invert elevation of 171.16 m). To achieve the quantity control requirements, two additional orifices are proposed:

- Orifice #2: dia = 100 mm, invert elevation = 171.81 m
- Orifice #3: dia = 190 mm, invert elevation = 172.60 m

Due to the presence of a high groundwater table, the target 3 m deep permanent pool is not feasible at SWMF-7, but the existing cooling trench downstream of the pond will be retained to provide additional thermal mitigation before flows from this facility are discharged to Brougham Creek. Storage and discharge characteristics of SWMF-7 are summarized in Table 5.7i.

Table 5.7i. Storage and Discharge Characteristics of SWMF-7

12hr AES Return Period	Allowable Release Rates Unit Rates - Subwatershed 44 (m^3/s)	SWMF-7 CHARACTERISTICS			Decrease Post-Development Controlled to Allowable Peak Flow (%)
		Storage Provided (m^3)	Storage Required (m^3)	Release Rate (m^3/s)	
2-yr	0.027	2642	2555	0.026	-3.14%
5-yr	0.043	3558	3298	0.031	-39.70%
10-yr	0.055	4199	3760	0.034	-61.75%
25-yr	0.071	4796	4349	0.069	-3.60%
50-yr	0.084	5250	4784	0.082	-2.97%
100-yr	0.098	5741	5210	0.093	-5.60%

A 975 mm STM outlet pipe is proposed for SWMF-7. It was sized to convey uncontrolled flows from the pond in case of clogging or emergency. The 2200 mm overflow weir at the top of the outlet structure (invert elevation of 173.02 m) serves as an emergency overflow spill for the pond. The pond is equipped with bottom draw pipe connected to the outlet structure.

Geographic constraints do not allow for drainage area A-24 (0.63 ha) to be connected to either SWMF-6 or SWMF-7; it will be revisited during detailed design to determine what quantity and quality control measures can be provided for this area.

5.2.2.6. Summary of SWM Pond Design for 407 TWY Stations

A summary of stormwater management facilities within the study limits is provided in Table 5.8. For facilities within the Rouge watershed (i.e.: SWMF-1, SWMF-2, and SWMF-3), the pond volume requirement is the sum of the permanent pool size requirement and the 5 mm retention volume. For the facilities in the Duffins watershed, the pond volume requirement is the sum of the permanent pool size requirement and the extended retention unitary rate storage.

Table 5.8. Summary of Stormwater Management Ponds within the Study Limits

Stormwater Management Facility (SWMF)	Location	Total Pond Volume Available (m^3)	Pond Volume Required (m^3)	Quality and Quantity Control
1	Markham Road	4,801	4,604	yes
2	Ninth Line	6,242	4,281	yes
3	Donald Cousens Parkway	4,545	3,645	yes
4	Whites Road (*)	7,835	3,453	yes
5	Whites Road (*)	4,575	2,408	yes
6	Brock Road (*)	7,045	2,638	yes
7	Brock Road	10,771	8,269	yes

(*) oversized pond due to 3.0m permanent pool depth as per MNRF requirements.

The stormwater management facilities in the Rouge watershed (at Markham Road, Ninth Line, and Donald Cousens Parkway Stations) all met the stormwater management criteria identified in Section 5.1. The facilities in the Duffins watersheds met most of the stormwater management criteria, with the following exceptions:

- The criteria for 120 hour retention of the 25 mm event could not be met at SWMF-4 because the orifice diameter required to meet this criteria (52 mm) was smaller than the 75 mm minimum required to prevent clogging. The 75 mm diameter orifice provides 57.6 hour detention of the 25 mm event; a shortfall of 62.4 hours. Due to the use of the 75 mm orifice, the 2-year required storage target could not be met by a shortfall of 49 m^3.

- The criteria for 120 hour retention of the 25 mm event could not be met at SWMF-5 because the orifice diameter required to meet this criteria (45 mm) was smaller than the 75 mm minimum required to prevent clogging. The 75 mm diameter orifice provides 44.3 hour detention of the 25 mm event; a shortfall of 75.7 hours. Due to the use of the 75 mm orifice, the 2-year required storage target could not be met by a shortfall of 79 m^3, the 2-year required flow target was exceeded by 1 L/s, and the 5-year required storage target could not be met by a shortfall of 16m^3.

- The criteria for 120 hour retention of the 25 mm event could not be met at SWMF-6 because the orifice diameter required to meet this criteria (52 mm) was smaller than the 75 mm minimum required to prevent clogging. The 75 mm diameter orifice provides 57.6 hour detention of the 25 mm event; a shortfall of 62.4 hours.

- Parsons looked at the feasibility of enlarging the footprint of the above-mentioned ponds to lower the hydraulic head of the orifice and found that the area of pond would be extremely large and there is no additional land to extend the surface area of the SWM facilities.

- Due to the presence of a high groundwater table, the target 3 m deep permanent pool could not be achieved at SWMF-7, but the existing cooling trench downstream of the pond will be retained to provide additional thermal mitigation before flows from this facility are discharged to Brougham Creek.

  During detailed design, the feasibility of connecting SWMF-4 and SWMF-5 should be assessed in order to achieve the storage and 120 hour detention criteria for Whites Road Station.

6. HYDRAULIC ANALYIS OF PROPOSED WATER CROSSINGS

As previously noted the proposed transitway crosses forty nine (49) watercourses, out of which twenty three (23) are major branches of creeks (such as Lower Rouge, Little Rouge, West Duffins Creek, Brougham Creek and others) and their tributaries. The remaining watercourses were identified as minor conveyance features with small localized tributary areas that the proposed TWY will not impact because of grade difference. Table 2.1 (in Section 2) provides details of all crossings within the study limits and compiles information reviewed from a variety of sources such as TRCA hydrologic modelling documentation for each watershed, impact assessment study for the project, summarizes available HEC-RAS models and floodplain maps received from TRCA. The table identifies each potential water crossing along the proposed 407 TWY.

A HEC-RAS analysis has been undertaken for the twenty three (23) water crossings within the study limits. A HEC-RAS model has been provided from TRCA for five (5) crossings (WC13, WC 15b, WC15C, WC18, WC28-29); refer to existing TRCA's floodplain mapping in Appendix F. For the remaining eighteen (18) water crossings analyzed the HEC-RAS model has been created from scratch using the flows determined in Section 4.1, using 4hr Chicago storm distribution and the MTO IDF curves.

6.1. Methodology

TRCA maintains and updates hydraulic models in digital form as HEC-RAS (River Analysis System) models in the area of this study. Digital floodplain mapping files were also obtained from TRCA to be used in the analysis. Refer to the existing floodplain mappings in Appendix F.

The proposed 407 TWY was overlaid on top of the existing floodplain mapping to determine existing cross-section information that needed to be updated and the location of new cross sections required to add the proposed crossings. Simply updating existing condition cross-sections to a HEC-RAS model can result in changes to the simulated flood levels. The HEC-RAS model was updated with new cross sections from the Civil 3D surface using

updated topography. These cross-sections were located to fit the proposed bridges or culverts as per model requirements. The updated model was used as the base model for the analysis and is called for the purposes of this report "*Modified Existing Model*"

6.2. Hydraulic Design Standards

For the purpose of this study, the following standards will be used from the MTO Drainage Manual (Jan 2008):

Standard WC-1: Design Flows (Bridges and Culverts)

- Road classification – Freeway;
- Design flow to be used as follows:

  For culverts with Total Span less than or equal to 6.0m - use 50-year return period (§ 1.1.1)

  For culverts with Total Span greater than 6.0m - use 100-year return period (§ 1.1.1)
- Check Flow for Scour – 130% of 100-year (§ 1.1.1)

Standard WC-2 – Freeboard and Clearance at Bridge Crossings

- The minimum freeboard is measured vertically from the High Water Level for the Design Flow (50-yr/100-yr WL) to the edge of the travelled lane (§ 3.1.2); the freeboard at bridge crossings shall be greater than or equal to 1m for freeways (§ 3.2.1).
- The clearance is measured vertically from the High Water Level of the Design Flow to the lowest point on the soffit (§ 3.1.3); the clearance for freeways shall be greater than or equal to 1m (§ 3.2.2).
- Zero clearance is required for the regulatory flow (§ 3.2.4).
- The WL generated by the Check Flow shall not exceed the elevation of the edge of the travelled lane (EOTL) (§ 3.2.5).

Standard WC-7 Culverts Crossings on a Watercourse

- Freeboard for the design flow should be at least one (1) m (§ 3.2)

Note: Minimum freeboard is measured vertically from the high water level for the design flow to the edge of the travelled lane (§ 3.1.2)

- Clearance for open footing culverts should be 0.3m (§ 3.4.1)

Note: clearance is measured vertically from the high water level for the design flow to the straight soffit

- Flood depth at culverts can be calculates as follows (§ 3.5):

  For culverts with diameter or rise <3m: HW/D ≤ 1.5

  For culverts with diameter or rise between (3 ÷4.5)m: HW/D ≤ 4.5

  For culverts with diameter or rise >4.5m): HW/D ≤ 1

Where HW represents the flood depth at the US face of the culvert and D is the Diameter/rise of the culvert

- Water Level Generated by the Check Flow (§ 3.6)

  Notes: Water level generated by check flow shall not exceed elevation of edge of travelled lane

Standard WC-8 Minimum Culvert Size

- Minimum Culvert Size for Freeways may be determined as follows (§ 3.1):

  800mm minimum diameter for circular culverts

  900mm minimum rise for box culverts

6.3. HEC-RAS Analysis - Rouge River Watershed

As part of this assignment the TRCA's HEC-RAS models were updated to include the existing 407ETR bridges. The hydraulic analyses of all structures are included in Appendix F. They include HEC-RAS model output files for all return periods (2-yr-to Regional), watercourse cross-sections.

The following summary tables include the proposed structure size, inverts, length and slope. In all cases regrading of the channels is needed and wingwalls are required to improve inlet flow conditions.

Existing 407 ETR structure sizes were estimated based on available data for this study, however sizes need to be confirmed during detailed design.

6.3.1. WC#3

The following results were produced from the HEC-RAS ROUGE model from the file HEC.prj. The geometry file used to model the existing conditions is named "WC3-EX", while the geometry file used to model the proposed conditions is named "WC3-PROP (3 x 1.25)".

The flow data used in HEC-RAS was determined using Visual OTTHYMO. Refer to Table 4.1 in section 4.1 of this report for flow data, and Figure 4.3 in Appendix C for the drainage area map of this crossing.

The existing 407 ETR structure upstream of the proposed transitway is approximately 2.0m in diameter (size available from background data review - to be confirmed during detailed design).

Table 6.3.1: WC#3 – Culvert Design Parameters

Type	Rigid frame open footing
Design flow – Q_{50yr} (m^3/s)	5.76
Sizing (Span x Height) (m)	3 x 1.25
UP INV (m)	178.50

5	100-yr	176.08	176.08	0.00
	Regional	175.95	175.95	0.00

Figure 6.1 in Appendix F shows the cross sections used for the HEC-RAS analysis and the associated water levels. The proposed Regional floodline is also delineated for this crossing.

6.3.2. WC#4

The following results were produced from the HEC-RAS ROUGE model from the file HEC.prj. The geometry file used to model the existing conditions is named "WC4-EX", while the geometry file used to model the proposed conditions is named "WC4-PROP (3 x 1.25)".

The flow data used in HEC-RAS was determined using Visual OTTHYMO. Refer to Table 4.1 in Section 4.1 of this report for flow data, and Figure 4.3 in Appendix C for the drainage area map of this crossing.

The existing drainage plan on 407 ETR needs to be confirmed during detailed design upstream of WC4. The inlet of the box culvert is observed on site, however the outlet needs to be confirmed.

Table 6.3.3: WC#4 – Culvert Design Parameters

Figure 6.3 in Appendix F shows the cross sections used for the HEC-RAS analysis and the associated water levels. The proposed Regional floodline is also delineated for this crossing.

6.3.4. WC#11

The following results were produced from the HEC-RAS ROUGE model from the file HEC.prj. The geometry file used to model the existing conditions is named "WC11 (EX)", while the geometry file used to model the proposed conditions is named "WC11 (PROP)-OPT4".

The flow data used in HEC-RAS was determined using Visual OTTHYMO. Refer to Table 4.1 in section 4.1 of this report for flow data, and Figure 4.4 in Appendix C for the drainage area map of this cross section.

Table 6.3.7: WC#11 – Culvert Design Parameters

Figure 6.5 in Appendix F shows the cross sections used for the HEC-RAS analysis and the associated water levels. The proposed Regional floodline is also delineated for this crossing.

6.3.6. WC#13

The following results were produced from the Rouge River model provided by TRCA named Rouge2001.prj. The TRCA model provided was updated to account for the existing 407 ETR Bridge. The geometry file used to model the existing conditions is named “Jan 13, 2016 (Mod EX-Parsons) (407ETR)”, while the geometry file used to model the proposed conditions is named “Jan 13, 2016 (PROP EX-Parsons) (407 ETR)”. The HEC-RAS Stations of interest are found in the geometry data under the MainRouge River and the Milne-Warden2 reach.

The existing bridge on the 407 ETR has a span of ~205m, while the proposed 407 TWY Bridge has a span of 300m.

Table 6.3.11: WC#13 - HEC-RAS Modelling Results

In the proposed conditions the WC#14 ditch needs to be realigned to discharge to WC13 upstream of the TWY

Figure 6.6 in Appendix F shows the cross sections used for the HEC-RAS analysis and the associated water levels. The proposed Regional floodline is also delineated for this crossing.

6.3.7. WC#15A

The following results were produced from the HEC-RAS ROUGE model from the file HEC.prj. The geometry file used to model the existing conditions is named “WC15A-EX”, while the geometry file used to model the proposed conditions is named “WC15A - PROP (6 x 1)”.

The flow data used in HEC-RAS was determined using Visual OTTHYMO. Refer to Table 4.1 in section 4.1 of this report for flow data, and Figure 4.5 in Appendix C for the drainage area map of this cross section.

Findings of our preliminary investigation show that the available survey at the time of this study does not show the two culverts on the 407 ETR (Refer to drawing SWM POND R-3b Plan dwg# 010B revision 5. May 29, 2001). In addition, the TRCA model should be updated to show the new development south of the 407 ETR. This needs to be considered during detailed design.

Due to the flat topography of the area, creek regrading was not feasible to lower proposed water levels; a berm is proposed to be constructed as shown in Figure 6.7 to avoid flooding of the TWY during larger storm events.

Table 6.3.12: WC#15A – Culvert Design Parameters

Type	Rigid frame open footing
Design flow – Q_{50yr} (m^3/s)	4.84
Sizing (Span x Height) (m)	6 x 1
UP INV (m)	180.02
DS INV (m)	179.90
Length (m)	28
Slope	0.4%

Table 6.3.13: WC#15A - HEC-RAS Modeling Results

HEC-RAS Sta	Return Period (4hr Chicago)	Ex Cond WL (m)	Prop Cond WL (m)	Diff in WLs (m)

150	Proposed 407 TWY Culvert			
100	100-yr	180.42	180.80	0.38
	Regional	180.23	180.55	0.32
50	100-yr	180.11	180.11	0.00
	Regional	179.94	179.94	0.00

Figure 6.7 in Appendix F shows the cross sections used for the HEC-RAS analysis and the associated water levels. The proposed Regional floodline is also delineated for this crossing. Future development in the area is recommended to be above 180.9m elevation to avoid flooding during the 100-yr event and larger.

6.3.8. WC#15B

The following results were produced from the Little Rouge A model provided by TRCA named TributaryA.prj. The TRCA model provided was updated to account for the existing 407 ETR culvert and the placement of the proposed 407 TWY. This involved updates to sections 6521.25, 6521.28, 6521.30 to the degree that they may be considered entirely new sections, and the removal of other sections that would cross the proposed transitway.

The geometry file used to model the existing conditions is named "Trib A (Modified EX-Parsons – 407ETR)", while the geometry file used to model the proposed conditions is named "Trib A and Trib D (PROP – 407ETR)". The HEC-RAS Stations of interest are found in the geometry data under the Tributary A river and the Reach 1 reach.

During detailed design the TRCA model should be updated to show new development south of 407ETR by Copper Creek Drive.

Table 6.3.14: WC#15B – Culvert Design Parameters

Crossing	Proposed 407 TWY	Existing 407 ETR*
Type	Rigid frame open footing	Box Culverts

6.3.9. WC#15C

The following results were produced from the Little Rouge A model provided by TRCA named TributaryA.prj. The TRCA model provided was updated to account for the existing 407 ETR Bridge. The geometry file used to model the existing conditions is named "Trib A (Modified EX-Parsons – 407ETR)", while the geometry file used to model the proposed conditions is named "Trib A and Trib D (PROP – 407ETR)". The HEC-RAS Stations of interest are found in the geometry data under the Tributary D river and the Reach 1 reach.

Figure 6.9 in Appendix F shows the cross sections used for the HEC-RAS analysis and the associated water levels. The proposed Regional floodline is also delineated for this crossing.

6.3.10. WC#16

The following results were produced from the HEC-RAS ROUGE model from the file HEC.prj. The geometry file used to model the existing conditions is named "WC16 - EX", while the geometry file used to model the proposed conditions is named "WC16 – PROP".

The flow data used in HEC-RAS was determined using Visual OTTHYMO Modelling. Refer to Table 4.1 in in section 4.1 of this report for the flow data of this crossing.

The existing 407 ETR culvert size is (4.6 x 2.7)m based on background data review of Pond 85 received from the City of Markham (Stormwater Management Report Cornell Community – Tributary C, MMM, Revised June 2004, Stormwater Management Cornell Community – Trib C, Revised July 2005). WC#16 is located downstream of the outlet of Pond 85, therefore the flow data was derived using the drainage area of Pond 85 (A=187.76ha). The model parameters were taken from the background report and flows were produced using the 4hr Chicago IDF curves from MTO. To follow a conservative approach, the uncontrolled flows were taken into consideration in the HEC-RAS model, not the controlled flows from SWM Pond 85.

Table 6.3.18: WC#16 – Culvert Design Parameters

Crossing	Culvert 1 - Proposed 407 TWY	Culvert 2 - TWY Driveway	Culvert 3 - Reesor Rd.
Type	Rigid frame open footing	Rigid frame open footing	Rigid frame open footing

6.3.11. WC#18

The following results were produced from the LittleRouge.all model provided by TRCA named all40147.prj. The TRCA model provided was updated to account for the existing 407 ETR Bridge. The geometry file used to model the existing conditions is named “Little – Dec.2015 (Mod Ex) (407 ETR)”, while the geometry file used to model the proposed conditions is named “Little – Sep.2016 (PROP) (407 ETR)”. The HEC-RAS Stations of interest are found in the geometry data under the Tributary D River and Reach 1.

The existing 407 ETR Bridge has a span of 190m, while the proposed TWY Bridge has a span of 252m.

Figure 6.11 in **Appendix F** shows the cross sections used for the HEC-RAS analysis and the associated water levels. The proposed Regional floodline is also delineated for this crossing.

6.3.12. Summary of Structures Performance – Rouge Watershed

Table 6.3.22 summarizes the culvert/structure performance and their compliance to the hydraulic design standards. The modeling results show that there are no increases in water levels beyond MTO's ROW and that small increases are limited to areas within MTO's property with the following exceptions:

i. WC#13, shows relatively small increases (5 cm) in Regional WL upstream of the 407 ETR, however the design criteria are met for this structure.

ii. WC#15A shows increase downstream of the transitway due to the flat topography which does not allow creek bottom re-grading; if any development is proposed in the area it is recommended to be above 180.8m elevation (100-yr WL, which is higher than the Regional level). In addition the TRCA model does not show the new development south of the 407 ETR. This needs to be considered during detailed design.

iii. The analysis undertaken for WC#16 assumes uncontrolled flows from Pond 85, which is a conservative approach. WC#16 shows increases in WLs downstream of the proposed Donald Cousens station however it is not feasible to install larger culverts size due to space constraints.

Compliance to the hydraulic design standards from the MTO Drainage Manual (Jan 2008) are met aside from WC#3 and WC#15A. WC#3 has a freeboard of only 0.28m, which is less than the minimum requirement of 1.0m. The freeboard requirements at WC#15A are not met because an underpass is proposed at Ninth Line, and thus a berm is proposed to prevent flooding onto the transitway (see Figure 6.7 in Appendix F). Overall, the proposed 407 TWY structures within Rouge River Watershed have a larger size compared to the existing 407 ETR structures.

Parsons updated the HEC-ARS models received from TRCA to show the 407 ETR existing structures as noted in the above tables. In addition, the TRCA floodlines for the four (4) crossings received from TRCA (WC13, WC 15b, WC15C, WC18) were updated to show the modified existing condition, which differs from TRCA. In all instances the modified existing and proposed floodlines delineated by Parsons are similar.

(*) Based on background data review (to be confirmed during detailed design)
(**) in these cases the vertical alignment of the corridor slopes to the underground and measures are needed to avoid water entering the underground portion of the corridor
(***) Controlled flow results from SWM Pond Upstream - Refer to report

Note: Culverts/bridges with a total span less than or equal to 6.0m are designed for 50yr storm (MTO Standard WC-1)
Culverts/bridges with a total span greater than 6.0 are design for the 100 yr storm (MTO Standard WC-1)
Freeboard calculated as the difference between the WL generated by the design flow and the EOTR
Clearance calculated as the difference between the lowest point on the soffit and the design flow
Check flow calculated as 1.3 times the design flow
Check flow criteria was assessed for crossing included in the HEC-RAS ROUGE model (HEC.prj) created by Parsons
Check flow criteria for TRCA models assessed in the report

6.4. Hydraulic Analysis – Petticoat Creek Watershed

6.4.1. WC#19

The following results were produced from the HEC-RAS ROUGE model from the file HEC.prj. The geometry file used to model the existing conditions is named "WC19-EX", while the geometry file used to model the proposed conditions is named "WC19-PROP (2.5 x 1.25)".

The flow data used in HEC-RAS was determined using Visual OTTHYMO. Refer to Table 4.1 in Section 4.1 of this report for flow data, and Figure 4.6 in Appendix C for the drainage area map of this crossing.

Table 6.4.1: WC#19 – Culvert Design Parameters

Type	Rigid frame open footing
Design flow – Q_{50yr} (m^3/s)	0.12

Figure 6.14 in Appendix F shows the cross sections used for the HEC-RAS analysis and the associated water levels. The proposed Regional floodline is also delineated for this crossing.

6.4.4. WC#21

The following results were produced from the HEC-RAS ROUGE model from the file HEC.prj. The geometry file used to model the existing conditions is named "WC21-EX", while the geometry file used to model the proposed conditions is named "WC21-PROP (4.5 x 2)".

The flow data used in HEC-RAS was determined using Visual OTTHYMO. Refer to Table 4.1 in Section 4.1 of this report for flow data, and Figure 4.6 in Appendix C for the drainage area map of this crossing

Table 6.4.7: WC#21 - Culvert Design Parameters

Type	Rigid frame open footing

Figure 6.15 in Appendix F shows the cross sections used for the HEC-RAS analysis and the associated water levels. The proposed Regional floodline is also delineated for this crossing.

6.4.5. Summary of Structures Performance - Petticoat Watershed

Table 6.4.9 summarizes the culvert/structure performance and their compliance to the hydraulic design standards. The modeling results show that there are no increases in water levels beyond MTO's ROW and that small increases are limited to areas within MTO's property. Compliance to the hydraulic design standards from the MTO Drainage Manual (Jan 2008) are met. The proposed structures have a larger size compared to the existing 407 ETR structures.

Table 6.4.9: 407 TWY - Water Crossings (Culverts/Bridges) Petticoat Creek Watershed - Design Parameters and Structure Performance

(*) Based on background data review (to be confirmed during detailed design)

Note: Culverts/bridges with a total span less than or equal to 6.0m are designed for 50yr storm (MTO Standard WC-1)
Culverts/bridges with a total span greater than 6.0 are design for the 100 yr storm (MTO Standard WC-1)
Freeboard calculated as the difference between the WL generated by the design flow and the EOTR
Clearance calculated as the difference between the lowest point on the soffit and the design flow
Check flow calculated as 1.3 times the design flow
Check flow criteria was assessed for crossing included in the HEC-RAS ROUGE model (HEC.prj) created by Parsons
Check flow criteria for TRCA models assessed in the report

6.5. HEC-RAS Analysis – Duffins Creek Watershed

6.5.1. WC#28 & WC#29

The following results were produced from the Duffins Creek Catchment 11 model provided by TRCA named DuffinCreekCatchment11.prj. The TRCA model provided was updated to account for the existing 407 ETR Bridge. The geometry file used to model the existing conditions is named "Duffin Crk Catch 11 (Modif EX) (407ETR)", while the geometry file used to model the proposed conditions is named "Duffin Crk Catch 11 (PROP) (407ETR)".

The existing 407 ETR Bridges have spans of 136m and 42m, while the proposed TWY Bridge has a span of ~300m.

Table 6.5.1: WC#28 & 29 - HEC-RAS Modeling Results

HEC-RAS Sta	Return Period *(4hr Chicago)*	TRCA Ex Cond WL (m)	Modif Ex Cond WL (m)	Diff in WLs TRCA vs Modif (m)	Prop Cond WL (m)	Diff in WLs Prop Cond vs Modif Ex Cond(m)

	Regional	177.14	177.15	0.01	177.15	0.00

Figure 6.16 in Appendix F shows the cross sections used for the HEC-RAS analysis and the associated water levels. The proposed Regional floodline is also delineated for this crossing. Minor increases are noted downstream of the 407 TWY (3 to 5cm increase) however the proposed TWY bridge has a span more than

doubled the existing 407 ETR bridge and exceeds the MTO design criteria by far with respect to clearance and freeboard.

6.5.2. WC#30

The following results were produced from the 407TWY-DUFFINS model from the file 407TWY-DUFFINS.prj. The geometry file used to model the existing conditions is named "WC30-EX", while the geometry file used to model the proposed conditions is named "WC30-PROP (6 x 2.5)".

The flow data used in HEC-RAS was determined using Visual OTTHYMO. Refer to Table 4.1 in section 4.1 of this report for flow data, and Figure 4.7 in Appendix C for the drainage area map of this crossing

Table 6.5.2: WC#30 - Culvert Design Parameters

Figure 6.23 in **Appendix F** shows the cross sections used for the HEC-RAS analysis and the associated water levels. The proposed Regional floodline is also delineated for this crossing.

6.5.9. Summary of Structures Performance

Table 6.5.15 summarizes the culvert/structure performance and their compliance to the MTO standards. The modeling results show that there are no increases in water levels beyond MTO's ROW and that small increases are limited to areas within MTO's property with the following exceptions: WC 28&28 shows relatively small increase in WLs downstream of the proposed 407 TWY (5cm increase in WLs for the regional storm); however the proposed TWY bridge has a span more than doubled the existing 407 ETR bridge and exceeds the MTO design criteria by far with respect to clearance and freeboard; and WC#30 shows minimum increase downstream of the transitway (2cm increase for the 100-yr) however the structure meets all MTO hydraulic design criteria.

Compliance to the hydraulic design standards from the MTO Drainage Manual (Jan 2008) are met for all structures.

Table 6.5.15: 407 TWY - Water Crossings (Culverts/Bridges) Duffins Creek Watershed - Design Parameters and Structure Performance

GENERAL INFO		ROADWAY DATA				EX 407 ETR STR*	Flow Data (4hr Chicago)				PROP 407 TWY STRUCTURE DESIGN PARAMETERS							HYDRAULICS				CULVERT/BRIDGE PERFORMANCE

(*) Based on background data review (to be confirmed during detailed design)

Note: Culverts/bridges with a total span less than or equal to 6.0m are designed for 50yr storm (MTO Standard WC-1)
Culverts/bridges with a total span greater than 6.0 are design for the 100 yr storm (MTO Standard WC-1)
Freeboard calculated as the difference between the WL generated by the design flow and the EOTR
Clearance calculated as the difference between the lowest point on the soffit and the design flow
Check flow calculated as 1.3 times the design flow
Check flow criteria was assessed for crossing included in the HEC-RAS ROUGE model (HEC.prj) created by Parsons
Check flow criteria for TRCA models assessed in the report

7. IMPACTS OF CLIMATE CHANGE

The impacts of climate change become more and more visible in recent years with increased annual average precipitation, more intense rainfall events, increased flooding, changes in temperature, snow and ice cover. In the last few years a number of extreme rainfall events (e.g: May 12, 2000, July 8, 2013 and others) were recorded that led to extensive flooding, damage to properties and traffic disruptions. Recent records (*Canada in a Changing Climate: Sector Perspectives on Impacts and Adaptation, Government of Canada, Lead Authors Fionna Warren and Donald S.Lemmen, Natural Resources Canada, 2014*) indicate that extreme weather events occur more frequently and the capacity of a system to adapt to a variety of environmental factors become paramount. The study previously noted indicates that the resilience and capacity to adapt are important key factors in designing new infrastructure since there is an emerging need to adapt infrastructure design to a changing climate.

There is additional capacity incorporated in the drainage design for the 407 TWY that makes the system somewhat resilient against the potential for more intense storm events and increased flows arising from climate change in the future.

The key measures to mitigate climate change impacts are:

- increased clearances at all crossings between the high water level and the underside of the bridge,
- increased freeboard for the majority of the structure due to the high road elevations; and
- use of a more conservative “peaky” design storm (Chicago 4-hr) compared to TRCA’s watershed criterion of 12-hr AES.

On the understanding that the 407 TWY is proposed to be built in the next 25 years, it is expected that design criteria will become more stringent as the impacts of climate change are better defined and quantified. However, there is flexibility in the current drainage design, as described above, to convey to some extent, the expected increased flows from climate change, on the assumption that humankind continues to take steps to reduce greenhouse gases and the negative impacts of climate change.

8. EROSION AND SEDIMENT CONTROL DURING CONSTRUCTION

The erosion and sediment control (ESC) practices to be developed during detailed design should follow the latest MTO’s reference documents including the Environmental Reference for Highway Design (MTO, June 2013), the Environmental Guide for Erosion and Sediment Control during Construction of Highway Projects (MTO, September 2015), as well as the Ontario Provincial Standards for Roads and Public Works (OPSS), and the Erosion and Sediment Control Guidelines for Urban Construction (Golden Horseshoe, Dec 2006).

Impacts on the surrounding environment related to highway projects can be mitigated by proper erosion and sediment control measures. MTO

It is recommended that a multi-barrier approach be undertaken during construction using the following measures as a minimum:

- Stabilize exposed soils with vegetation where possible to reduce the amount of sediments that would be conveyed further downstream to existing watercourses;
- Implement construction phasing to limit the duration of soil exposure;
- Install heavy-duty double silt fence at each water crossing;
- Double silt fence to be supported by straw-bale;
- Install rock check dams to reduce high flow velocities in the ditches/swales adjacent to the proposed transitway;
- Erosion and sediment control blankets for the road embankments;
- Dewatering, temporary channel diversions; and
- Use erosion prevention controls and sediment control measures as necessary.

9. CONCLUSIONS AND CONSIDERATIONS FOR DETAILED DESIGN

1. Several ponds could be impacted by the proposed 407 TWY and mitigation measures are recommended as follows:

    - Existing pond ID R-4 at Kennedy Rd: a super-elevated structure is proposed at this location and the piers are located such that no interference with the existing pond is expected.

    - Pond LR-1 upstream of Donald Cousens Parkway Station may be impacted by the proposed 407 TWY; it is recommended that the pond be re-graded to suite proposed transitway profile; retaining walls may be required on the north side of the TWY (refer to Figure 6.1 in Appendix F).

    - Existing 407 ETR pond LR-5, east of WC#18 may require regrading due to proposed embankments of the 407 TWY.

    - Existing 407 ETR Pond WD-2 inlet (east of WC#30) – a new culvert is required across the transitway since inlet of the pond will be cut-off by the proposed TWY.

    - Existing 407 ETR pond G1 inlet (east of WC#40) – a new culvert is required across the transitway since inlet of the pond will be cut-off by the proposed TWY.

    - Existing pond 03West, located north of Brock Road Station – regrading of pond embankment may be required to allow grading of the proposed 407 TWY embankment.

2. The stormwater management strategy recommends that flows from several enhanced swales along the proposed 407 TWY be directed to the existing 407 ETR ditches and ultimately to existing ponds. Ponds LR-1, LR-5, WD-2 and G1 were identified as possible outlets. It is recommended that the capacity of existing 407 ponds to be assessed during detailed design to confirm if sufficient capacity exists for additional flows.

3. Due to the road profile sloping to the underground, pumping may be required at three locations along the proposed 407 TWY: Markham Road, Donald Cousens Parkway and York Durham Line. Peak flows were tabulated and additional details related to pump sizes should be provided during detailed design.

4. A treatment train approach is proposed for the TWY corridor areas consisting of grassed embankments, long grassed swales and enhanced swales in a form of dry ponds with a formal outlet control structure. Quantity control of transitway flows is proposed to be provided through enhanced swales. These were designed as dry ponds with a formal outlet control structure consisting of 100 mm perforated pipe, hickenbottom structure and a 75 mm orifice plate. A typical cross-section was used in the analysis however a more detailed analysis

needs to be undertaken during detailed design to ensure compliance with the latest allowable release rates (unit rates) in Duffins subwatersheds 8, 31, 35 and 39.

5. The increases in peak flows in the post-development condition with SWM compared to the allowable rates vary between 0.001 L/s and 0.004 L/s at the outlet of the swales. These increases can be considered small and do not pose significant erosion/scour impacts at the outlets. Velocities could be further mitigated with vegetated outlets or energy dissipaters. Parsons looked at the feasibility of enlarging the footprint of the enhanced swales to lower the hydraulic head of the 75 mm orifice and found that the area of ponding would be larger than the transitway segment itself.

6. The SWM strategy for the stations include wet ponds with control structures consisting of multiple orifices and/or weirs. Wet ponds were designed for each station site to provide quantity, quality and erosion and sediment control. One facility is recommended at each station in the Rouge watershed, and two facilities are recommended at each station in the Duffins watershed. The stormwater management facilities in the Rouge watershed (at Markham Road, Ninth Line, and Donald Cousens Parkway Stations) all met the stormwater management criteria identified in Section 5.1. The facilities in the Duffins watersheds met most of the stormwater management criteria, with the following exceptions:

    - The criteria for 120 hour retention of the 25 mm event could not be met at SWMF-4, SWMF-5, or SWMF-6 because the orifice diameter required to meet this criteria was smaller than the 75 mm minimum required to prevent clogging. During detailed design, the feasibility of connecting SWMF-4 and SWMF-5 should be assessed in order to achieve the storage and 120-hr detention criteria for Whites Road Station.

    - Parsons looked at the feasibility of enlarging the footprint of the above-mentioned ponds to lower the hydraulic head of the orifice and found that the area of pond would be extremely large and there is no additional land to extend the surface area of the SWM facilities.

    - Due to the presence of a high groundwater table, the target 3 m deep permanent pool could not be achieved at SWMF-7; the existing cooling trench downstream of the pond will be retained to provide additional thermal mitigation before flows from this facility are discharged to Brougham Creek.

7. HEC-RAS analysis

    a. The HEC-RAS analysis was undertaken for 23 crossings within the study limits. Out of the 23 crossings, TRCA provided 5 HEC-RAS models and the rest were started from scratch. The HEC-RAS models from

TRCA were updated to include the 407 ETR existing structures for the majority of the crossings within the study limits. The modified existing levels are different compared to the elevations provided by TRCA.

b. The regional floodline was delineated for all crossings within the study limits.

c. The modeling results show that there are no increases in water levels beyond MTO's ROW and that small increases are limited to areas within MTO's property with the following exceptions

   i. WC#13, shows relatively small increases (5 cm) in Regional WL upstream of the 407 ETR, however the design criteria are met for this structure.

   ii. WC#15A shows increase downstream of the transitway due to the flat topography which does not allow creek bottom re-grading; if any development is proposed in the area it is recommended to be above 180.8m elevation (100-yr WL, which is higher than the Regional level). In addition the TRCA model does not show the new development south of the 407 ETR. This needs to be considered during detailed design.

   iii. The analysis undertaken for WC#16 assumes uncontrolled flows from Pond 85, which is a conservative approach. WC#16 shows increases in WLs downstream of the proposed Donald Cousens station however it is not feasible to install larger culverts size due to space constraints.

   iv. WC 28&28 shows relatively small increase in WLs downstream of the proposed 407 TWY (5cm increase in WLs for the regional storm). However the proposed TWY bridge has a span more than doubled the existing 407 ETR bridge and exceeds the MTO design criteria by far with respect to clearance and freeboard.

   v. WC#30 shows minimum increase downstream of the transitway (2cm increase for the 100-yr) however the structure meets all MTO hydraulic design criteria.

The results presented above are not expected to have negative impacts or damage private properties

d. Compliance to the hydraulic design standards from the MTO Drainage Manual (Jan 2008) are met aside from WC#3 and WC#15A.

e. The freeboard and clearance for most of the structures exceed the required by more than 1m in most instances. Therefore there is flexibility in the future to consider climate change impacts.

GENERAL NOTES

1. SPECIFICATIONS:
   - ONTARIO PROVINCIAL STANDARD SPECIFICATIONS
   - ONTARIO HIGHWAY BRIDGE DESIGN CODE, 1991.
2. LIVE LOAD:
   - OHBDC-91 HIGHWAY CLASS 'A'
3. CLASS OF CONCRETE:
   - PRECAST CONCRETE GIRDERS 50 MPa
   - REMAINDER 30 MPa
4. CLEAR COVER TO REINFORCING STEEL:
   - FOOTINGS 100± 25
   - DECK:
     - TOP 70± 20
     - BOTTOM 40± 10
   - REMAINDER: (UNLESS OTHERWISE NOTED) 70± 20
5. REINFORCING STEEL:
   - REINFORCING STEEL SHALL BE GRADE 400 UNLESS OTHERWISE SPECIFIED.
   - BAR MARKS WITH PREFIX 'C' DENOTE COATED BARS.
6. CONTRACTOR SHALL ESTABLISH THE ACTUAL BEARING SEAT ELEVATIONS BY DEDUCTING THE BEARING THICKNESSES FROM THE TOP OF BEARING ELEVATIONS. IF THE ACTUAL BEARING THICKNESSES ARE DIFFERENT FROM THOSE GIVEN BY THE BEARING DESIGN DATA, THE CONTRACTOR SHALL ADJUST THE REINFORCING STEEL.

GENERAL NOTES:

A. SWM PONDS ARE TO BE UTILIZED AS TEMPORARY SEDIMENTATION BASINS. PONDS SHALL BE CONSTRUCTED AT THE OUTSET OF THE WORK AND ALL APPROPRIATE CONSTRUCTION FLOWS ARE TO BE DIRECTED INTO THE PONDS WHEREVER PRACTICAL. THE CONTRACTOR SHALL MAINTAIN THE PONDS AND REMOVE SEDIMENT AS REQUIRED BY THE CONTRACT ADMINISTRATOR. PRIOR TO OPENING OF THE HIGHWAY THE PONDS ARE TO BE CLEANED AND REINSTATED TO A "NEW" CONDITION.

B. UPON COMPLETION OF THE POND EXCAVATION AND GRADING, THE CONTRACTOR SHALL ADVISE THE CONTRACT ADMINISTRATOR. THE CONTRACT ADMINISTRATOR SHALL TAKE SOIL SAMPLES TO ASSESS THE POTENTIAL INFILTRATION AND SEEPAGE QUALITIES OF THE POND FACILITY. IF REQUIRED, A POND LINER WILL BE PLACED PRIOR TO COMPLETION OF THE POND CONSTRUCTION.

C. MINIMUM 6.5m RADIUS TO BE MAINTAINED WHERE ACCESS ROADS MATCH WITH HIGHWAY SHOULDERS AND HAMMERHEAD.

NOTES:

1. FOR POND PARAMETERS AND OUTLET DETAIL SEE DRAWING E1-0052.
2. FOR SECTION A-A AND SECTION B-B SEE DRAWING E1-0058.
3. FOR ACCESS ROAD PROFILE SEE DRAWING E1-0050.
4. FOR ACCESS ROAD CROSS SECTION AND DRAINAGE DITCH TYPE SEE DRAWING E1-0063.
5. ACCESS ROAD GRADING SLOPE WITHIN CLEAR ZONE OF RAMP IS 6:1.
6. HWY 407 10 LANES POND R-1 VOLUME 4100m³.
7. ULTIMATE POND GRADING AND FUTURE ACCESS TO BE DETERMINED BY TRANSITWAY DESIGN.
8. IMPLEMENT EROSION CONTROL METHODS DURING CONSTRUCTION OF OUTLET PAD TO PREVENT SEDIMENT TRANSPORT INTO RIVER.

GENERAL NOTES:

A. SWM PONDS ARE TO BE UTILIZED AS TEMPORARY SEDIMENTATION BASINS. PONDS SHALL BE CONSTRUCTED AT THE OUTSET OF THE WORK AND ALL APPROPRIATE CONSTRUCTION FLOWS ARE TO BE DIRECTED INTO THE PONDS, WHEREVER PRACTICAL. THE CONTRACTOR SHALL MAINTAIN THE PONDS AND REMOVE SEDIMENT AS REQUIRED BY THE CONTRACT ADMINISTRATOR. PRIOR TO OPENING OF THE HIGHWAY THE PONDS ARE TO BE CLEANED AND REINSTATED TO A 'NEW' CONDITION.

B. UPON COMPLETION OF THE POND EXCAVATION AND GRADING, THE CONTRACTOR SHALL ADVISE THE CONTRACT ADMINISTRATOR. THE CONTRACT ADMINISTRATOR SHALL TAKE SOIL SAMPLES TO ASSESS THE POTENTIAL INFILTRATION AND SEEPAGE QUALITIES OF THE POND FACILITY. IF REQUIRED, A POND LINER WILL BE PLACED PRIOR TO COMPLETION OF THE POND CONSTRUCTION.

C. MINIMUM 6.5m RADIUS, TO BE MAINTAINED WHERE ACCESS ROADS MATCH WITH HIGHWAY SHOULDERS AND HAMMERHEAD.

NOTES:

1. FOR POND PARAMETERS AND OUTLET DETAIL SEE DRAWING E1-0057.
2. FOR SECTION C-C SEE DRAWING E1-0058.
3. FOR ACCESS ROAD PROFILE SEE DRAWING E1-0056.
4. FOR ACCESS ROAD CROSS SECTION AND DRAINAGE DITCH TYPE SEE DRAWING E1-0063.
5. ACCESS ROAD GRADING SLOPE WITHIN CLEAR ZONE OF HWY 407 IS 6:1.
6. HWY 407 10 LANES POND R-2 VOLUME = 9750m³.

GENERAL NOTES:

A. SWM PONDS ARE TO BE UTILIZED AS TEMPORARY SEDIMENTATION BASINS. PONDS SHALL BE CONSTRUCTED AT THE OUTSET OF THE WORK AND ALL APPROPRIATE CONSTRUCTION FLOWS ARE TO BE DIRECTED INTO THE PONDS, WHEREVER PRACTICAL. THE CONTRACTOR SHALL MAINTAIN THE PONDS AND REMOVE SEDIMENT AS REQUIRED BY THE CONTRACT ADMINISTRATOR. PRIOR TO OPENING OF THE HIGHWAY THE PONDS ARE TO BE CLEANED AND REINSTATED TO A "NEW" CONDITION.

B. UPON COMPLETION OF THE POND EXCAVATION AND GRADING, THE CONTRACTOR SHALL ADVISE THE CONTRACT ADMINISTRATOR. THE CONTRACT ADMINISTRATOR SHALL TAKE SOIL SAMPLES TO ASSESS THE POTENTIAL INFILTRATION AND SEEPAGE QUALITIES OF THE POND FACILITY. IF REQUIRED, A POND LINER WILL BE PLACED PRIOR TO COMPLETION OF THE POND CONSTRUCTION.

C. MINIMUM 6.5m RADIUS, TO BE MAINTAINED WHERE ACCESS ROAD MATCH WITH HIGHWAY SHOULDERS AND HAMMERHEAD.

PRIOR TO OPENING OF THE HIGHWAY THE PONDS ARE TO BE CLEANED AND REINSTATED TO A "NEW" CONDITION.

B. UPON COMPLETION OF THE POND EXCAVATION AND GRADING, THE CONTRACTOR SHALL ADVISE THE CONTRACT ADMINISTRATOR. THE CONTRACT ADMINISTRATOR SHALL TAKE SOIL SAMPLES TO ASSESS THE POTENTIAL INFILTRATION AND SEEPAGE QUALITIES OF THE POND FACILITY. IF REQUIRED, A POND LINER WILL BE PLACED PRIOR TO COMPLETION OF THE POND CONSTRUCTION.

C. MINIMUM 6.5m RADIUS, TO BE MAINTAINED WHERE ACCESS ROADS MATCH WITH HIGHWAY SHOULDERS AND HAMMERHEAD.

GENERAL NOTES:

A. SWM PONDS ARE TO BE UTILIZED AS TEMPORARY SEDIMENTATION BASINS. PONDS SHALL BE CONSTRUCTED AT THE OUTSET OF THE WORK AND ALL APPROPRIATE CONSTRUCTION FLOWS ARE TO BE DIRECTED INTO THE PONDS, WHEREVER PRACTICAL. THE CONTRACTOR SHALL MAINTAIN THE PONDS AND REMOVE SEDIMENT AS REQUIRED BY THE CONTRACT ADMINISTRATOR. PRIOR TO OPENING OF THE HIGHWAY THE PONDS ARE TO BE CLEANED AND REINSTATED TO A "NEW" CONDITION.

B. UPON COMPLETION OF THE POND EXCAVATION AND GRADING, THE CONTRACTOR SHALL ADVISE THE CONTRACT ADMINISTRATOR. THE CONTRACT ADMINISTRATOR SHALL TAKE SOIL SAMPLES TO ASSESS THE POTENTIAL INFILTRATION AND SEEPAGE QUALITIES OF THE POND FACILITY. IF REQUIRED, A POND LINER WILL BE PLACED PRIOR TO COMPLETION OF THE POND CONSTRUCTION.

C. MINIMUM 6.5m RADIUS, TO BE MAINTAINED WHERE ACCESS ROADS MATCH WITH HIGHWAY SHOULDERS AND HAMMERHEAD.

GENERAL NOTES:

A. SWM PONDS ARE TO BE UTILIZED AS TEMPORARY SEDIMENTATION BASINS. PONDS SHALL BE CONSTRUCTED AT THE OUTSET OF THE WORK AND ALL APPROPRIATE CONSTRUCTION FLOWS ARE TO BE DIRECTED INTO THE PONDS, WHEREVER PRACTICAL. THE CONTRACTOR SHALL MAINTAIN THE PONDS AND REMOVE SEDIMENT AS REQUIRED BY THE CONTRACT ADMINISTRATOR. PRIOR TO OPENING OF THE HIGHWAY THE PONDS ARE TO BE CLEANED AND REINSTATED TO A "NEW" CONDITION.

B. UPON COMPLETION OF THE POND EXCAVATION AND GRADING, THE CONTRACTOR SHALL ADVISE THE CONTRACT ADMINISTRATOR. THE CONTRACT ADMINISTRATOR SHALL TAKE SOIL SAMPLES TO ASSESS THE POTENTIAL INFILTRATION AND SEEPAGE QUALITIES OF THE POND FACILITY. IF REQUIRED, A POND LINER WILL BE PLACED PRIOR TO COMPLETION OF THE POND CONSTRUCTION.

C. MINIMUM 6.5m RADIUS, TO BE MAINTAINED WHERE ACCESS ROADS MATCH WITH HIGHWAY SHOULDERS AND HAMMERHEAD.

NOTES:

1. FOR POND PARAMETERS AND OUTLET DETAIL SEE DRAWING E1-0062.
2. FOR SECTION J-J SEE DRAWING E1-0061.
3. FOR ACCESS ROAD PROFILE SEE DRAWING E1-0052.
4. FOR ACCESS ROAD CROSS SECTION AND DRAINAGE DITCH TYPE SEE DRAWING E1-0063.
5. ACCESS ROAD GRADING SLOPE WITHIN CLEAR ZONE OF HWY 407 IS 6:1.
6. HWY 407 10 LANES POND LR-5 VOLUME = 890m³.

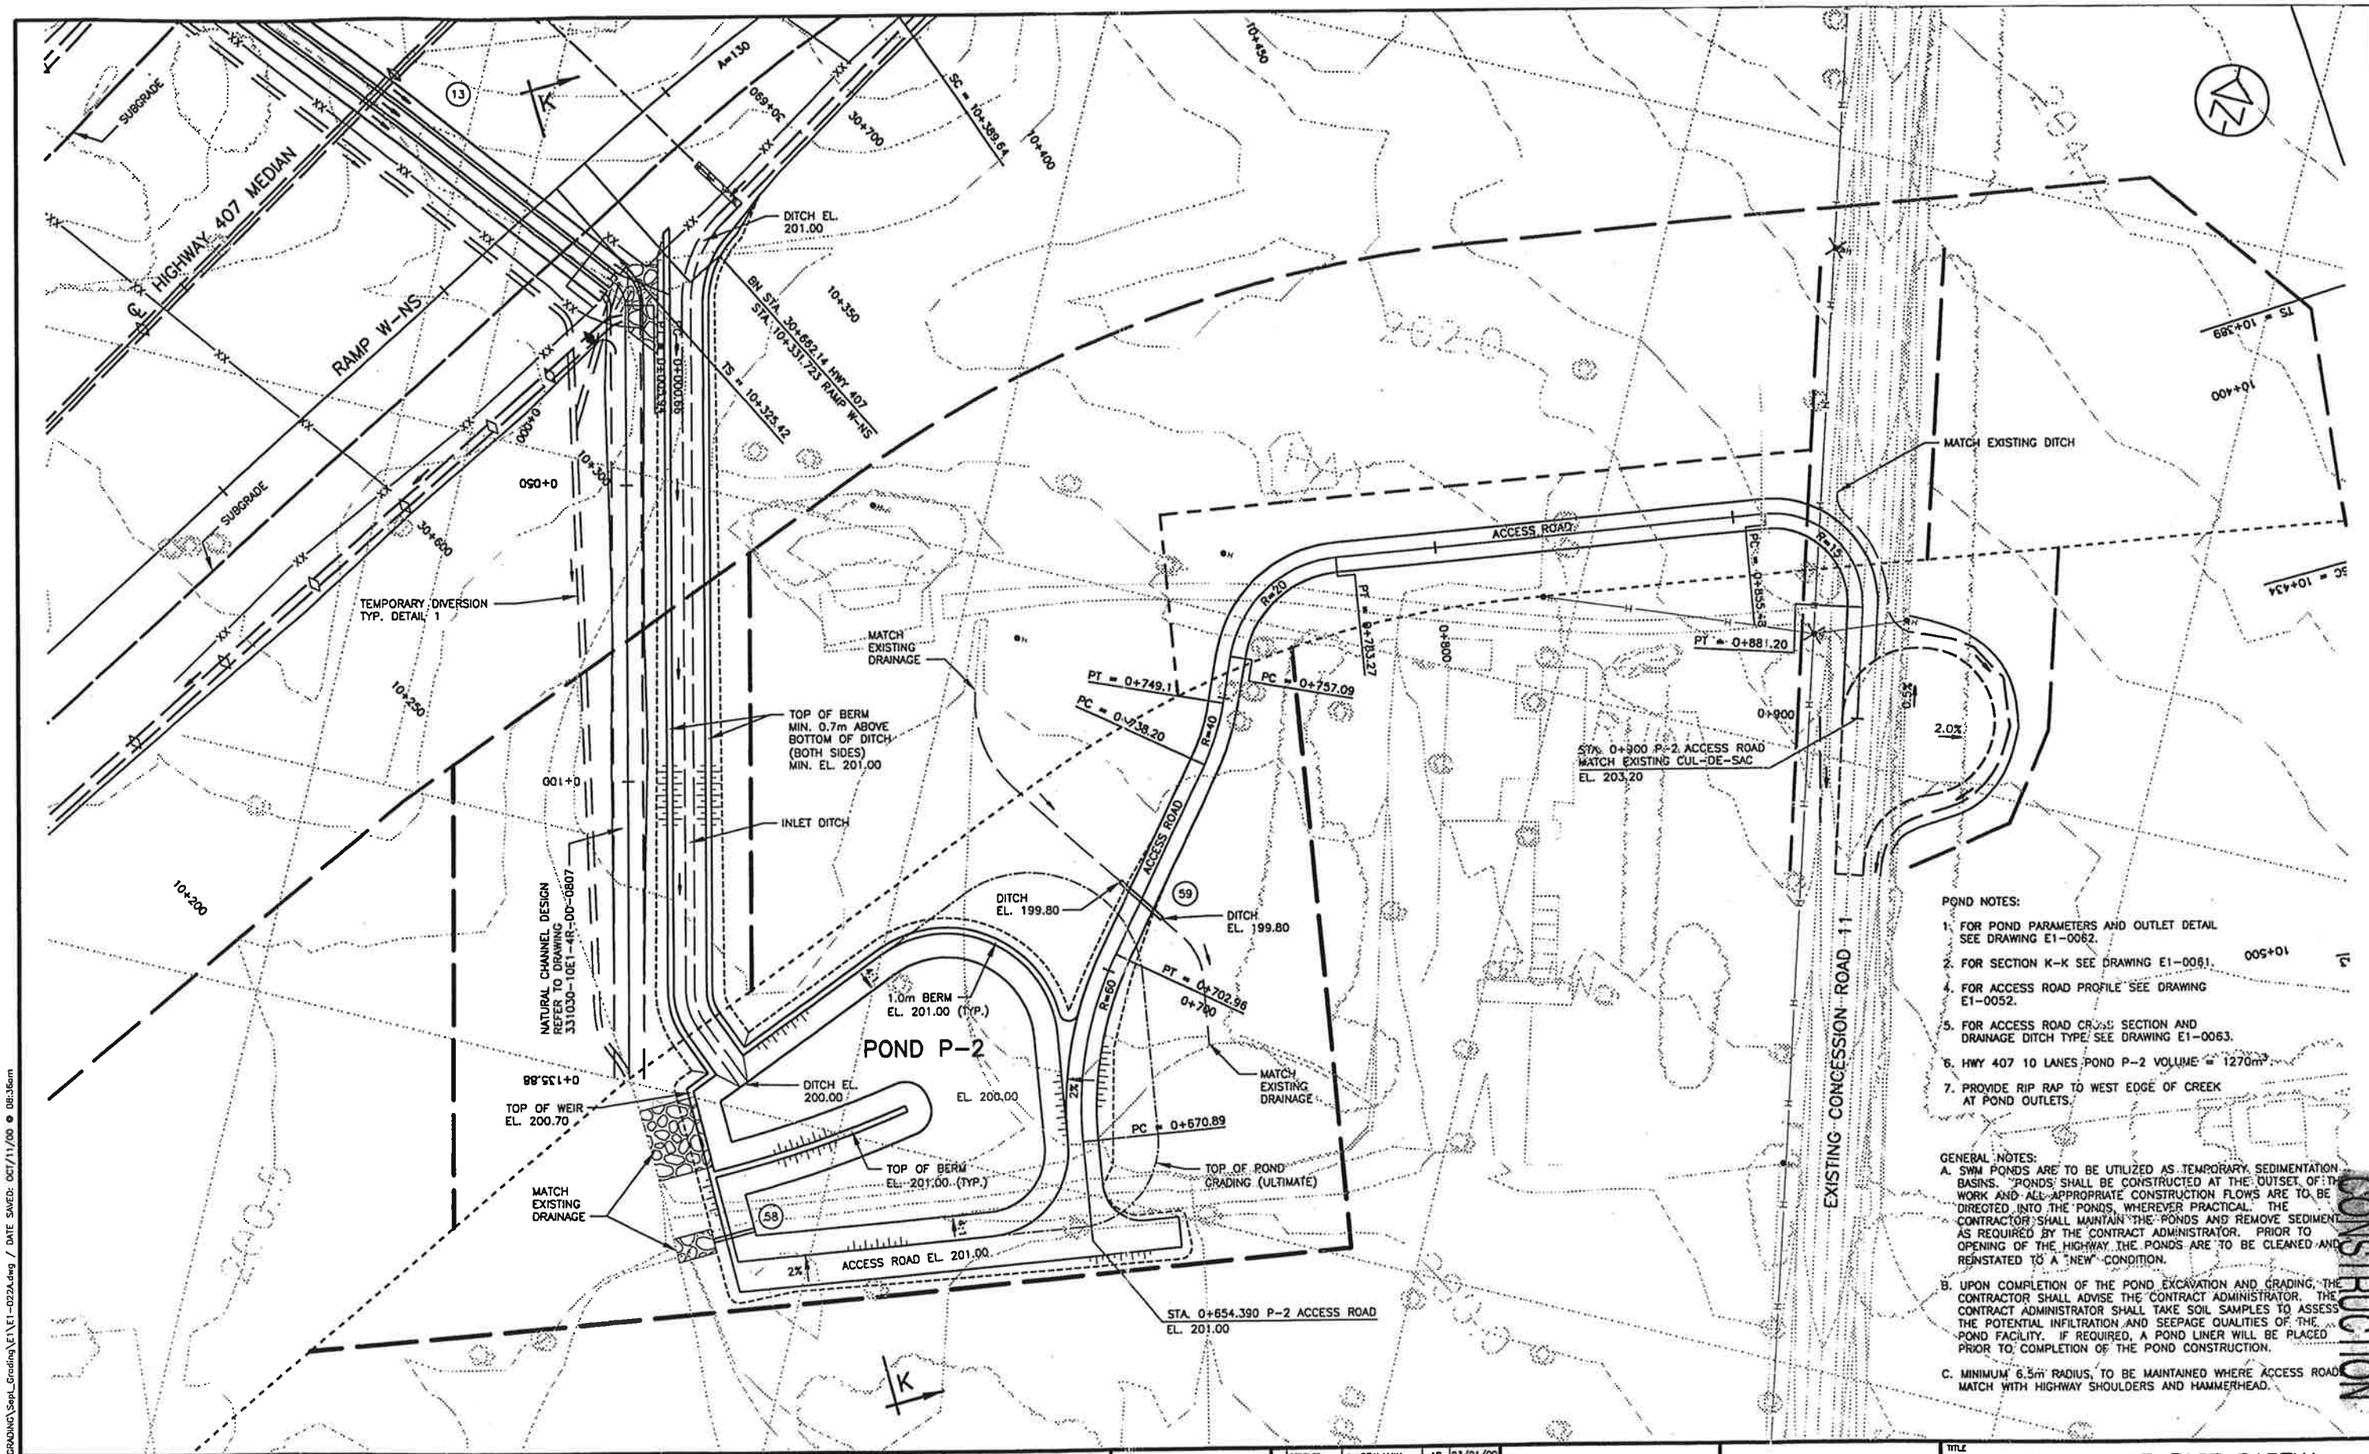
TITLE: HIGHWAY 407 EAST PARTIAL
TYPICAL POND ACCESS RD. X–SECT.
AND DRAINAGE DITCH DETAILS

PROJECT NO.	SUBDIVISION	DISC.	DOC.	DRAWING NUMBER	REVISION NUMBER
331030	10E1	4R	DD	0063	6



POND NOTES:

1. FOR POND PARAMETERS AND OUTLET DETAIL SEE DRAWING E1-0062.
2. FOR SECTION K-K SEE DRAWING E1-0061.
4. FOR ACCESS ROAD PROFILE SEE DRAWING E1-0052.
5. FOR ACCESS ROAD CROSS SECTION AND DRAINAGE DITCH TYPE SEE DRAWING E1-0063.
6. HWY 407 10 LANES POND P-2 VOLUME = 1270m³.
7. PROVIDE RIP RAP TO WEST EDGE OF CREEK AT POND OUTLETS.

GENERAL NOTES:

A. SWM PONDS ARE TO BE UTILIZED AS TEMPORARY SEDIMENTATION BASINS. PONDS SHALL BE CONSTRUCTED AT THE OUTSET OF THE WORK AND ALL APPROPRIATE CONSTRUCTION FLOWS ARE TO BE DIRECTED INTO THE PONDS, WHEREVER PRACTICAL. THE CONTRACTOR SHALL MAINTAIN THE PONDS AND REMOVE SEDIMENT AS REQUIRED BY THE CONTRACT ADMINISTRATOR. PRIOR TO OPENING OF THE HIGHWAY THE PONDS ARE TO BE CLEANED AND REINSTATED TO A "NEW" CONDITION.

B. UPON COMPLETION OF THE POND EXCAVATION AND GRADING, THE CONTRACTOR SHALL ADVISE THE CONTRACT ADMINISTRATOR. THE CONTRACT ADMINISTRATOR SHALL TAKE SOIL SAMPLES TO ASSESS THE POTENTIAL INFILTRATION AND SEEPAGE QUALITIES OF THE POND FACILITY. IF REQUIRED, A POND LINER WILL BE PLACED PRIOR TO COMPLETION OF THE POND CONSTRUCTION.

C. MINIMUM 6.5m RADIUS, TO BE MAINTAINED WHERE ACCESS ROAD MATCH WITH HIGHWAY SHOULDERS AND HAMMERHEAD.

4. FOR ACCESS ROAD CROSS SECTION AND DRAINAGE DITCH TYPE SEE DRAWING E2-0057.
5. ACCESS ROAD GRADING SLOPE WITHIN CLEAR ZONE OF HWY 407 IS 6:1.
6. HIGHWAY 407 10-LANES POND G-1 VOLUME : 3770m³

GENERAL NOTES :

A. SWM PONDS ARE TO BE UTILIZED AS TEMPORARY SEDIMENTATION BASIN. POND SHALL BE CONSTRUCTED AT THE OUTSET OF THE WORK AND ALL APPROPRIATE CONSTRUCTION FLOWS ARE TO BE DIRECTED INTO THE PONDS WHEREVER PRACTICAL. THE CONTRACTOR SHALL MAINTAIN THE PONDS AND REMOVE SEDIMENT AS REQUIRED BY THE CONTRACT ADMINISTRATOR. PRIOR TO OPENING OF THE HIGHWAY THE PONDS ARE TO BE CLEANED AND REINSTATED TO A 'NEW' CONDITION.

B. UPON COMPLETION OF THE POND EXCAVATION AND GRADING, THE CONTRACTOR SHALL ADVISE THE CONTRACT ADMINISTRATOR. THE CONTRACT ADMINISTRATOR SHALL TAKE SOIL SAMPLES TO ASSESS THE POTENTIAL INFILTRATION AND SEEPAGE QUALITIES OF THE POND FACILITY. IF REQUIRED, A POND LINER WILL BE PLACED PRIOR TO COMPLETION OF THE POND CONSTRUCTION.

C. MINIMUM 6.5m RADIUS TO BE MAINTAINED WHERE ACCESS ROADS MATCH HIGHWAY SHOULDERS AND HAMMERHEAD.

GENERAL DESCRIPTION

Enhanced grass swales are vegetated open channels designed to convey, treat and attenuate stormwater runoff (also referred to as enhanced vegetated swales). Check dams and vegetation in the swale slows the water to allow sedimentation, filtration through the root zone and soil matrix, evapotranspiration, and infiltration into the underlying native soil. Simple grass channels or ditches have long been used for stormwater conveyance, particularly for roadway drainage. Enhanced grass swales incorporate design features such as modified geometry and check dams that improve the contaminant removal and runoff reduction functions of simple grass channel and roadside ditch designs.

Where development density, topography and depth to water table permit, enhanced grass swales are a preferred alternative to both curb and gutter and storm drains as a stormwater conveyance system. When incorporated into a site design, they can reduce impervious cover, accent the natural landscape, and provide aesthetic benefits.

DESIGN GUIDANCE

GEOMETRY AND SITE LAYOUT

- Shape: Should be designed with a trapezoidal or parabolic cross section. Trapezoidal swales will generally evolve into parabolic swales over time, so the initial trapezoidal cross-section design should be checked for capacity and conveyance assuming it is a parabolic cross-section. Swale length between culverts should be 5 metres or greater.
- Bottom Width: Should be designed with a bottom width between 0.75 and 3.0 metres. Should allow for shallow flows and adequate water quality treatment, while preventing flows from concentrating and creating gullies.
- Longitudinal Slope: Slopes should be between 0.5% and 4%. Check dams should be incorporated on slopes greater than 3%.
- Length: When used to convey and treat road runoff, the length simply parallels the road, and therefore should be equal to, or greater than the contributing roadway length.
- Flow Depth: A maximum flow depth of 100 mm is recommended during a 4 hour, 25 mm Chicago storm event.
- Side Slopes: Should be as flat as possible to aid in providing pretreatment for lateral incoming flows and to maximize the swale filtering surface. Steeper side slopes are likely to have erosion gullying from incoming lateral flows. A maximum slope of 2.5:1 (H:V) is recommended and a 4:1 slope is preferred where space permits.

PRE-TREATMENT

A pea gravel diaphragm located along the top of each bank can be used to provide pretreatment of any runoff entering the swale laterally along its length. Vegetated filter strips or mild side slopes (3:1) also provide pretreatment for any lateral sheet flow entering the swale. Sedimentation forebays at inlets to the swale are also a pretreatment option.

CONVEYANCE AND OVERFLOW

Grass swales must be designed for a maximum velocity of 0.5 m/s or less for the 4 hour 25 mm Chicago storm event. The swale should also convey the locally required design storm (usually the 10 year storm) at non-erosive velocities.

SOIL AMENDMENTS

If soils along the location of the swale are highly compacted, or of such low fertility that vegetation cannot become established, they should be tilled to a depth of 300 mm and amended with compost to achieve an organic content of 8 to 15% by weight or 30 to 40% by volume.

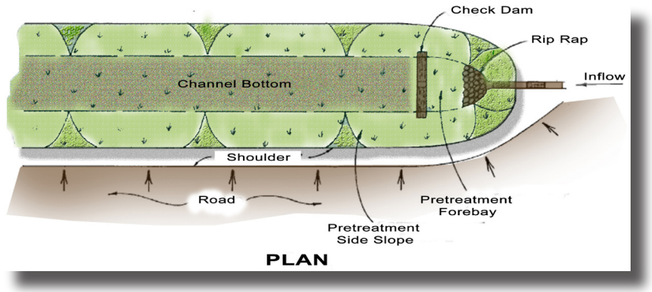
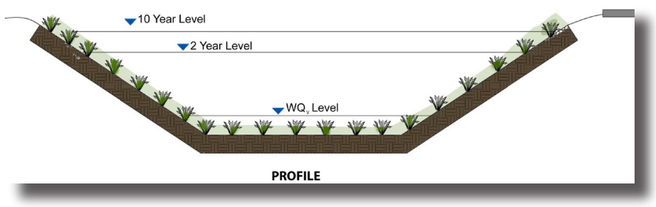
PLAN VIEW OF A GRASS SWALE





PLAN AND PROFILE VIEWS

ABILITY TO MEET SWM OBJECTIVES

BMP	Water Balance Benefit	Water Quality Improvement	Stream Channel Erosion Control Benefit
Enhanced Grass Swale	Partial - depends on soil infiltration rate	Yes, if design velocity is 0.5 m/s or less for a 4 hour, 25 mm Chicago storm	Partial - depends on soil infiltration rate

GENERAL SPECIFICATIONS

Component	Specification	Quantity
Check Dams	Constructed of a non-erosive material such as suitably sized aggregate, wood, gabions, riprap, or concrete. All check dams should be underlain with geotextile filter fabric. Wood used for check dams should consist of pressure treated logs or timbers, or water-resistant tree species such as cedar, hemlock, swamp oak or locust.	Spacing should be based on the longitudinal slope and desired ponding volume.
Gravel Diaphragm	Washed stone between 3 and 10 mm in diameter.	Minimum of 300 mm wide and 600 mm deep.

CONSTRUCTION CONSIDERATIONS

Grass swales should be clearly marked before site work begins to avoid disturbance during construction. No vehicular traffic, except that specifically used to construct the facility, should be allowed within the swale site. Any accumulation of sediment that does occur within the swale must be removed during the final stages of grading to achieve the design cross-section. Final grading and planting should not occur until the adjoining areas draining into the swale are stabilized. Flow should not be diverted into the swale until the banks are stabilized.

Preferably, the swale should be planted in the spring so that the vegetation can become established with minimal irrigation. Installation of erosion control matting or blanketing to stabilize soil during establishment of vegetation is highly recommended. If sod is used, it should be placed with staggered ends and secured by rolling the sod. This helps to prevent gullies.

OPERATION AND MAINTENANCE

Generally, routine maintenance will be the same as for any other landscaped area; weeding, pruning, and litter removal. Grassed swales should be mown at least twice yearly to maintain grass height between 75 and 150 mm. The lightest possible mowing equipment should be used to prevent soil compaction. Routine roadside ditch maintenance practices such as scraping and re-grading should be avoided. Regular watering may be required during the first two years until vegetation is established. Routine inspection is very important to ensure that dense vegetation cover is maintained and inlets and pretreatment devices are free of debris.

For the first two years following construction the swale should be inspected at least quarterly and after every major storm event (> 25 mm). Subsequently, inspections should be conducted in the spring and fall of each year and after major storm events. Inspect for vegetation density (at least 80% coverage), damage by foot or vehicular traffic, accumulation of debris, trash and sediment, and structural damage to pretreatment devices.

Trash and debris should be removed from pretreatment devices and the surface of the swale at least twice annually. Other maintenance activities include weeding, replacing dead vegetation, repairing eroded areas, dethatching and aerating as needed. Remove accumulated sediment on the swale surface when dry and exceeding 25 mm depth.

SITE CONSIDERATIONS

Available Space
Grass swales usually consume about 5 to 15% of their contributing drainage area. A width of at least 2 metres is needed.

Site Topography
Site topography constrains the application of grass swales. Longitudinal slopes between 0.5 and 6% are allowable. This prevents ponding while providing residence time and preventing erosion. On slopes steeper than 3%, check dams should be used.

Drainage Area & Runoff Volume
The conveyance capacity should match the drainage area. Sheet flow to the grass swale is preferable. If drainage areas are greater than 2 hectares, high discharge through the swale may not allow for filtering and infiltration, and may create erosive conditions. Typical ratios of impervious drainage area to treatment facility area range from 5:1 to 10:1.

Soil
Grass swales can be applied on sites with any type of soils.

Pollution Hot Spot Runoff
To protect groundwater from possible contamination, source areas where land uses or human activities have the potential to generate highly contaminated runoff (e.g., vehicle fueling, servicing and demolition areas, outdoor storage and handling areas for hazardous materials and some heavy industry sites) should not be treated by grass swales.

Proximity to Underground Utilities
Utilities running parallel to the grass swale should be offset from the centerline of the swale. Underground utilities below the bottom of the swale are not a problem.

Water Table
The bottom of the swale should be separated from the seasonally high water table or top of bedrock elevation by at least one (1) metre.

Setback from Buildings
Should be located a minimum of four (4) metres from building foundations to prevent water damage.

MARKHAM ROAD STATION HYDROLOGIC ANALYSIS - EXISTING CONDITION

Input parameters

Proposed Markham Station is located within Subcatchment 614& 312 - Rouge Watershed
For modeling purposes, input parameters of Area 614 are used in VO2 (ID 614- Standhyd)

CN= 76.7
Ia= 5
Drainage area Total (ha)= 7.21 (A1 to A7)

Table 5.1a: Markham Road Station Hydrologic Analysis - Existing Condition

Table 5.1d: MARKHAM STATION Proposed SWMF-1 - Design Parameters

Pond Catchment Area 5.94 ha

Water Quality Storage Requirements

MOECC (2003, Table 3.2)

Level 1	265 m^3/ha	Interpolated from Table 3.2 (MOECC)		
Extended	40 m^3/ha	(or 25mm rainfall event whichever greater)	*237.60*	m^3
25 mm Event From OTTHYMO	19.75 mm		*1,173.15*	m^3
% imperviousness	90 %			
Permanent Volume Required			*1,336.50*	m^3

Quantity Control Required

Total Volume required up to and including the 100 yr storm **2,257.00** m^3

Total Pond Volume Required (Permanent and Extended) **3,593.50** m^3

Settling Calculations MOECC Eq. 4.5

$$Dist = \sqrt{\frac{r \times Q_p}{V_s}}$$

Dist	16	Minimum Forebay length	m
r	5.73	Length to width ratio	-
Qp	0.01	Peak flow rate from the pond during design quality storm	m^3/s
Vs	0.0003	settling velocity	m/s

Dispersion Length MOECC Eq. 4.6

$$Dist = \frac{8Q}{dV_f}$$

Minimum Width 2 m

Dist	13	Minimum Dispersion Length	
Q	0.39	Inlet Flow Rate	(5 year Storm)
d	1.6	Depth of the Permanent Pool	
Vf	0.15	Desired Velocity in the Forebay	

(0.15 m/s is the maximum permissible velocity before erosion occurs in a channel (MOECC))

Minimum Forebay Deep Zone Bottom Width MOECC Eq. 4.7

Width = Dist/8 Width 1.97 m

Design Quality Storm MOECC Eq 4.9

$$i_{25} = 43C + 5.9$$

A	5.94	Area	
C	90	Runoff Coefficient	
i	44.6	Intensity	mm/hr
Qp	0.67	Flow Rational Method	

Flow Velocity Check

Qd	0.39	Inlet Flow Rate	m^3/s
A	8.78	Crossectional Area	m^2
Vfb	0.044	Flow Velocity	m/s
	Yes	< 0.15	

Forebay Dimensions

3:1	Average Side Slope	%
40.60	Top Length	m
29.14	Bottom Length	m
7.30	Average Top Width	m

Table 5.2d: NINTH LINE STATION - Proposed SWMF-2 - Design Parameters

Pond Catchment Area 7.47 ha

Water Quality Storage Requirements

MOECC (2003, Table 3.2)

Level 1	265 m^3/ha	Interpolated from Table 3.2 (MOECC)		
Extended	40 m^3/ha	(or 25mm rainfall event whichever greater)	*298.80*	m^3
25 mm Event From OTTHYMO	19.61 mm		*1,464.87*	m^3
% imperviousness	90 %			
Permanent Volume Required			*1,680.75*	m^3

Quantity Control Required

Total Volume required up to and including the 100 yr storm **2,992.00** m^3

Total Pond Volume Required (Permanent and Extended) **4,672.75** m^3

Settling Calculations MOECC Eq. 4.5

$$Dist = \sqrt{\frac{r \times Q_p}{V_s}}$$

Dist	10	Minimum Forebay length	m
r	1.87	Length to width ratio	-
Qp	0.02	Peak flow rate from the pond during design quality storm	m^3/s
Vs	0.0003	settling velocity'	m/s

Dispersion Length MOECC Eq. 4.6

$$Dist = \frac{8Q}{dV_f}$$

Minimum Width 2 m

Dist	14	Minimum Dispersion Length	
Q	0.57	Inlet Flow Rate	(5 year Storm)
d	2.1	Depth of the Permanent Pool	
Vf	0.15	Desired Velocity in the Forebay	

(0.15 m/s is the maximum permissible velocity before erosion occurs in a channel (MOECC))

Minimum Forebay Deep Zone Bottom Width MOECC Eq. 4.7

Width = Dist/8 Width 1.25 m

Design Quality Storm MOECC Eq 4.9

$$i_{25} = 43C + 5.9$$

A	7.47	Area	
C	90	Runoff Coefficient	
i	44.6	Intensity	mm/hr
Qp	0.84	Flow Rational Method	

Flow Velocity Check

Qd	0.57	Inlet Flow Rate	m^3/s
A	49.06	Crossectional Area	m^2
Vfb	0.012	Flow Velocity	m/s
	Yes	< 0.15	

Forebay Dimensions

4.5:1	Average Side Slope	%
54.79	Top Length	m
18.43	Bottom Length	m
31.96	Average Top Width	m
7.29	Bottom Width	m
2.50	Average Depth of the Pool	m
728.10	Approximate Volume of the Pool	m^3
1681	Total Permanent Pool Volume	m^3
0.43	Forebay/Total Volume Ratio	
469	Forebay Area	m^2
2097	Total Permanent Pool Area	
0.22	Forebay/Total Area Ratio	
1.87	Average L/W Ratio Check	

Forebay Cleanout Frequency

Ac	7.47	Contributing Area	(ha)
Ds	0.6	Maximum Sediment Depth	(m)
Vsf	295	Maximum Sediment Volume	(m^3)
a	30%	Impervious Level	%
da	0.6	Annual Sediment Loading	(m^3/ha/yr) (Table 6.3 MOECC Manual)
Fs	65.8	Forebay Cleanout Frequency	(years)
	75%	Target Maintenance TSS Removal Efficiency
